Cancer Incidence in Five Continents

Volume XI

INTERNATIONAL AGENCY FOR RESEARCH ON CANCER

The International Agency for Research on Cancer (IARC) was established in 1965 by the World Health Assembly, as an independently financed organization within the framework of the World Health Organization (WHO). The headquarters of the Agency are in Lyon, France.

The Agency conducts a programme of research concentrating particularly on the epidemiology of cancer and the study of potential carcinogens in the human environment. Its epidemiological studies are supplemented by studies of the mechanisms of carcinogenesis carried out in the Agency's laboratories in Lyon. The promotion of collaborative research among scientists worldwide is a strong feature of the Agency's activities. The Agency also conducts a programme for the education and training of personnel for cancer research.

The publications of the Agency are intended to contribute to the dissemination of authoritative information on various aspects of cancer research. Information about IARC publications and how to order them is available online at https://publications.iarc.fr/.

INTERNATIONAL ASSOCIATION OF CANCER REGISTRIES

The International Association of Cancer Registries (IACR) was created following the Ninth International Cancer Congress, held in Tokyo, Japan, in 1966. The Association is a voluntary nongovernmental organization in official relations with WHO, representing the scientific and professional interests of cancer registries, with members interested in the development of cancer registration and its application to studies of well-defined populations.

There are currently more than 700 member registries in IACR, along with an elected executive board. Since 1973, IARC has provided a secretariat for the Association, with the primary functions of organizing meetings and coordinating scientific studies. Information about the Association, including membership, activities, and publications, is available online at http://www.iacr.com.fr/.

Foreword

Over the past half a century, the International Agency for Research on Cancer (IARC) has advocated for the critical importance of population-based cancer registries in providing the evidence base to inform cancer control and cancer research. Since the publication of the first volume of *Cancer Incidence in Five Continents* (CI5), by Sir Richard Doll and colleagues, in 1966, each new volume represents a unique resource for cancer researchers worldwide. In providing comparable quinquennial data on incident cancers from high-quality registries, the publication remains invaluable in documenting the evolving magnitude and profile of cancer in different locations of the world.

With CI5 Volume XI, we continue to see an expansion of international registry coverage, with 343 cancer registries in 65 countries contributing incidence data on cancers diagnosed during the period from 2008 to 2012. Although both the call for data and the editorial processes used in compiling this volume were similar to those for previous volumes, some practical changes to the book format were inevitably required. With an ever-expanding number of registries worldwide submitting data to CI5 – almost 500 registries submitted data to Volume XI – the publication has been somewhat abridged compared with previous volumes, with several of the extensive tables now available online. A renewed focus has been placed on the development of web-based data visualization tools that seek to showcase the wealth of data that the CI5 volumes bring to descriptive epidemiological research.

CI5 is a major resource for understanding patterns and trends of cancers worldwide, and fortunately an increasing number of registries are submitting data from low- and middle-income countries. However, much work still remains to be done to ensure that comparable incidence data are available in all corners of the world. The strict evaluation of data quality that is needed to ensure comparability of incidence rates can impede some registries in resource-constrained settings in meeting the high standards of operations and data output necessary to be included in a volume of CI5. IARC is committed to supporting and strengthening cancer registries in low- and middle-income countries via the Global Initiative for Cancer Registry Development (GICR), a multi-organization partnership that seeks to address this gap while ensuring that national cancer control plans are monitored and evaluated on the basis of reliable data recorded locally.

Finally, a looming issue has been the safeguarding of data confidentiality. Unfortunately, some long-standing, high-quality registries were not able to submit their data to CI5 Volume XI because of national data protection regulations. IARC is exploring long-term solutions that will facilitate the sharing of these precious data. Direct liaison with registries through the International Association of Cancer Registries (IACR), and the support of and collaboration with registries worldwide has been a cornerstone activity of the Agency, and every effort will be made to preserve and cultivate this vital link with registries throughout the world over the next 50 years.

I take this opportunity to warmly thank all registries that submitted their data to this volume. I thank you for your enduring collaborations with IARC – long may they continue!

Chapter 1: Introduction and guide to this volume

Freddie Bray and Jacques Ferlay

The *Cancer Incidence in Five Continents* (CI5) series, published jointly by the International Agency for Research on Cancer (IARC) and the International Association of Cancer Registries (IACR), remains a unique source of data on cancer incidence around the world. The principal objective of the series is to present comparable data on cancer incidence for all countries around the world for which high-quality data have been made available by population-based cancer registries. The provision of comparable incidence data by place (within volumes) and over time (between volumes) provides evidence of the environmental, lifestyle, and infectious origin of many common cancers, and their potential avoidability (Doll et al., 1966; Bray et al., 2015).

This volume of CI5 (Volume XI) provides information about cancers diagnosed during the period from 2008 to 2012. Every effort has been made to ensure that the information included in this volume can be used with assurance to compare geographical patterns and – by comparison with data from earlier volumes – temporal trends in cancer. In CI5 Volume I, the editors remarked that "the most valuable data are, undoubtedly, the rates obtained by recording the occurrence of every case of cancer in a defined community over a specified period" (Doll et al., 1966). More than a half century later, in Volume XI, this principle remains the raison d'être for the CI5 series. The recording and assessment of rates remains a core task of cancer registries today, and it is the function of CI5 to report registry results using a common format.

CALL FOR DATA

For CI5 Volume XI, a call for data and an accompanying questionnaire were sent to all population-based cancer registries that were members of IACR in June 2015. The call for data and the questionnaire were also published on the IACR website, with both documents available in English, French, and Spanish. Registries that wished to submit datasets for Volume XI were requested to do so using the IARC Registries Portal (see Chapter 6), and the questionnaire was available for completion online. Detailed instructions for preparing the registry dataset and the accompanying mortality and population information were provided in the call for data. In some countries, registries delegated data submission to their national associations or networks, but each registry was required to submit its own responses to the questionnaire.

Although the reference time period for Volume XI was defined as 2008–2012, contributors were also asked to send data for years before and (if available) after the reference period, to allow the volume editors to verify certain aspects of quality, comparability, and completeness for each submission. Not all registries were able to provide data for the whole time period covered by Volume XI, but a minimum consecutive series of 3 years was required for a registry to be considered for inclusion.

NUMBER OF DATASETS RECEIVED AND INCLUDED

Data were received from 483 cancer registries covering 636 populations in 90 countries. Data from 140 cancer registries, representing 171 populations, were excluded. Volume XI consequently presents cancer incidence data from 65 countries, 343 cancer registries, and 465 populations (Table 1.1).

GEOGRAPHICAL COVERAGE IN CI5 VOLUME XI

The geographical coverage in CI5 Volume XI by continent is shown in Table 1.2. Data are included from 6 of the 21 African countries that submitted data, 11 of the 13 Central and South American countries, 2 of the 3 North American countries, 17 of the 21 Asian countries, 28 of the 31 European countries, and 4 of the 4 Oceanic countries.

Table 1.1. The number of cancer registry datasets (2008–2012) submitted to and accepted for CI5 Volume XI

	Submitted	Accepted
Countries	90	65
Registries	483	343
Populations	636	465

Table 1.2. Geographical coverage in CI5 Volume XI by continent

	Countries		Registries		Populations	
	Submitted	Accepted	Submitted	Accepted	Submitted	Accepted
Africa	21	6	30	7	30	7
Central and South America	13	11	45	31	45	31
North America	3	2	71	69	206	171
Asia	21	17	182	97	187	105
Europe	31	28	143	127	145	129
Oceania	4	4	12	12	23	22
Total	90*	66*	483	343	636	465

*The sum of the number of individual countries is greater than the total, reflecting the fact that some countries (i.e. France and the USA) have territory on more than one continent.

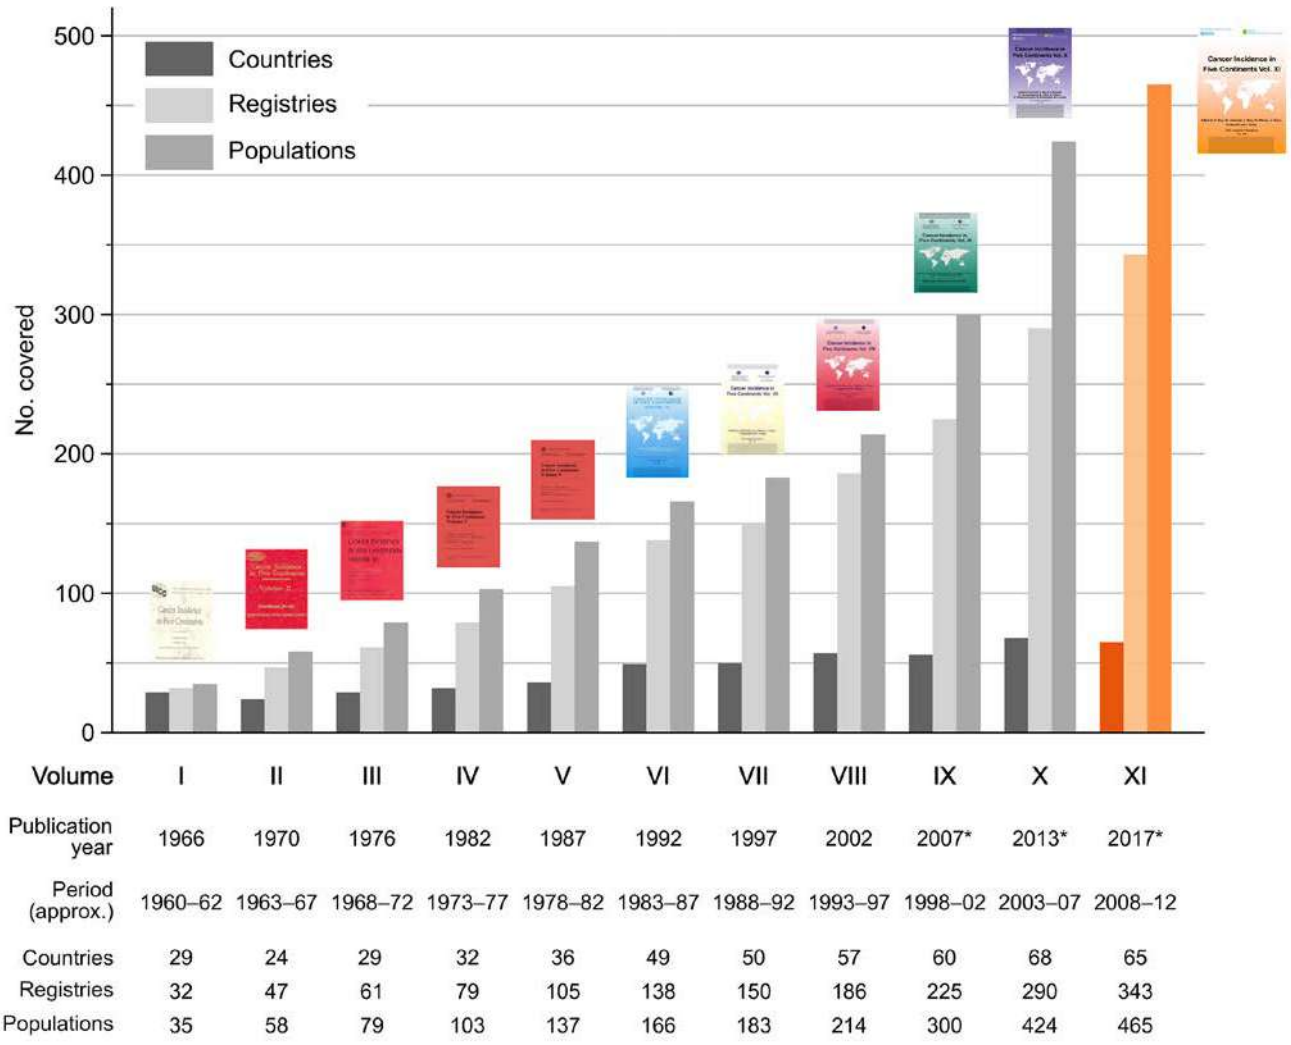
The proportions of cancer registries that submitted datasets for Volume XI and were accepted for inclusion (by continent) are as follows: Africa, 23% (7/30); Central and South America, 69% (31/45); North America, 97% (69/71); Asia, 53% (97/182); Europe, 88% (127/143); and Oceania: 100% (12/12).

The proportion of the world's total population covered by the registries included in Volume XI is 15%, with the following levels of coverage by continent: Africa, 1%; Central and South America, 8%; North America, 98%; Asia, 7%; Europe, 46%; and Oceania, 77%.

COVERAGE IN THE 11 VOLUMES OF CI5

Fig. 1.1 shows the overall coverage in terms of the number of countries, registries, and populations included in each volume of CI5. A full overview identifying all the registry populations appearing in all 11 volumes, as well as the specific incidence time periods contributed by each registry, is provided in Table 1.3 at the end of this chapter.

The steady increase in coverage of the world's population by cancer registration has been accompanied by critical developments in the standardization of registration methodology, definitions, and coding. The editors of the present volume, building on the foundation laid in the first volumes, have made every effort to standardize the data presented, or where this was not possible, to draw attention to any differences that might affect comparability between registries. The editorial processes of checking internal coherence, consistency, and completeness are described in Chapters 5 and 6 of this volume and are broadly based on principles outlined in IARC Scientific Publication No. 95 (Jensen et al., 1991) and IARC Technical Publication No. 43 (Bray et al., 2014).



Improved definition of registration methodology and increased adherence to internationally recognized standards have also led to more stringent editorial processes. With each successive volume of CI5, the editors have become more demanding about the quality of the data published in the book. However, the editors also have to accept that some datasets from registries in lower-income countries may be less complete than those from registries in higher-income countries, because of problems of underdiagnosis due to local medical and economic situations (as opposed to underregistration) and/or problems with enumeration of the population. But these datasets are nevertheless of great interest because they describe cancer incidence in populations for which no other information is available and that retain unique cultural habits that may provide valuable clues to cancer etiology.

On the pages of this volume that present tables reporting the data from each registry by site, an asterisk preceding the registry title indicates that special considerations (which may include underregistration) must be taken into account in interpreting the published rates or indicators of quality (see Chapter 5). The specific reasons for a given asterisk are stated under the heading "Notes on the data" in the accompanying text.

CONTENT AND LAYOUT OF THE BOOK

For the first time in the history of the CI5 series, Volume XI is being published in a somewhat abridged version compared with the format that has been a constant across all 10 of the previous volumes. This is necessary, given the ever-expanding number of registries worldwide (notably in China) contributing to CI5; based on the previous template in a single publication, Volume XI would have had about 2000 pages. Furthermore, the focus is now on developing online tools that enable visual exploration of this incredibly rich data source: documenting the necessary registry information – the registration area, the population covered, the cancer care facilities, the data acquisition and processing techniques, and the source(s) of population data – alongside dedicated analytical tools for the data from individual registries on the IACR website (http://iacr.com.fr), and focusing on an exposition of the secular trends that are (to a certain extent) representative of a single country on the forthcoming Cancer Over Time subsite of the IARC Global Cancer Observatory (https://gco.iarc.fr).

Maps showing the location of each contributing registry are provided on pages 2–20.

Volume	I	II	III	IV	V	VI	VII	VIII	IX	X	XI

Introductory chapters

In this volume, after this introductory text, Chapter 2 describes the registries in terms of geographical location, legislative background, and registration practices. Chapter 3 presents the system of classification used to report the incidence data, and addresses the issue of comparability of coding practices between the registries. For selected cancers, the data have been analysed by histological subtype within site. Chapter 4 introduces the histological groupings used and explains the rationale behind them.

Issues that can affect comparability between registries and validity of registry data are discussed in Chapter 5, as are the methods by which the submitted datasets were assessed. Chapter 6 describes how the raw data received for CI5 were processed. Finally, Chapter 7 describes the summary measures of incidence used in this volume to enable comparisons across registry populations.

Registry-specific entries

After the standard introductory chapters, registry-specific entries are presented in alphabetical order within each world region. Each population label includes the name of the country, the name of the region (if applicable), the name of the subpopulation (such as racial or ethnic group, if applicable), and the time period of data contribution. Each registry-specific entry provides a list of individual contributors at the registry, together with summary statistics from the accepted dataset.

For each population defined by a registry, a population pyramid is provided, showing the average annual person-years at risk during the reference period, for males and females, in 5-year age groups. The number of age groups depends on the age distribution of the population data provided. The horizontal bars of the pyramids represent the percentage contribution of each sex–age group to the total population. References to the source(s) of population data are provided.

A table is provided that shows the sex-specific age-standardized rates per 100 000 population observed in each registry area during the reference period for the 20 most common cancers, and for all sites combined. In addition, a one-page overview table per population presents sex-specific statistics for all ages: the total number of cases, the percentage contribution of each cancer site to the total, and the incidence rates (crude

and standardized rates per 100 000, and cumulative rates for the age ranges 0–64 years and 0–74 years, expressed as percentages). The cancer sites are arranged in ascending order of International Statistical Classification of Diseases and Related Health Problems, 10th revision (ICD-10) codes, which are displayed along with the site labels. Where applicable, these tables are provided for each subpopulation defined by the registry.

Comparative cancer incidence tables

What follows are comparative summary tables by site (ICD-10 three-digit rubrics). The set of tables shows all cancers combined (including and excluding non-melanoma skin cancers), the three-digit (ICD-10) cancer sites described in Chapter 3, and the three grouped categories "Head and neck", "Colon and rectum", and "Leukaemia". Each table for these categories shows sex-specific data for all ages combined, including the number of cases, the age-standardized incidence rate (using the world standard population), and the cumulative incidence rate for the age range 0–74 years. The rates are accompanied by their standard errors.

All submitted datasets were subjected to computerized records checks and editorial review. The decision about whether to include a given dataset in Volume XI was largely based on the data quality indicators, which are described and tabulated in Chapter 5. Other indicators are presented systematically for all registries in the site-specific tables entitled *Indices of data quality* located at the end of this volume.

FUTURE DIRECTIONS OF CI5

As stated, the online presence of CI5 will seek to draw attention to the data as critical to national and global cancer control and cancer research. These features will be available as part of the IARC Global Cancer Observatory in the Cancer Over Time subsite, with a focus on national trends, based on national or subnational registry data included in consecutive volumes of CI5, and on the IACR website, which will include narratives of the registries included in each volume, including the present one, with registry-specific data analyses available online.

This long-standing collaboration between IARC and IACR serves as a unique source of cancer incidence data from high-quality population-based cancer registries around the world. It continues to be an invaluable resource for cancer research and cancer control worldwide, and is the primary source of GLOBOCAN and national estimates in 185 countries by cancer, sex, and age, currently for 2020 (https://gco.iarc.fr/today/).

In closing, it is worth restating that the ability to publish results and demonstrate progress is a challenge for many registries in resource-limited settings. The strict criteria of CI5 can be a limiting factor to inclusion for registries. To ensure a more equitable means of disseminating results, there is also a plan to develop a set of parallel continental reports that will include data from all population-based registries within defined regions. These reports will include discussion of the specific difficulties in the registries and possible solutions. This activity aims to link the complementary activities of the IARC-led Global Initiative for Cancer Registry Development (https://gicr.iarc.fr) and those of IACR to foster and enhance regional networking.

ACKNOWLEDGEMENTS

The editors would like to thank Sébastien Antoni, who spent considerable time processing the data and questionnaire responses sent by each submitting registry. The CI5 Volume XI Editorial Board, IACR, and IARC take this opportunity to thank the many directors and registrars of cancer registries around the world that submitted their data to Volume XI of CI5, for their efforts to produce cancer incidence data and make them available to the global community. Their work remains the cornerstone of descriptive cancer epidemiology and provides a basis for future cancer research and cancer control policies.

Chapter 2: Registration techniques

Ariana Znaor and Roberto Zanetti

Cancer registration procedures differ globally from region to region, and are at least in part dependent on local factors, including the level of development of cancer information systems and the resources available to the registry. The *Cancer Incidence in Five Continents* (CI5) series compiles a set of comparable high-quality data on the incidence rates of specific cancers in different populations and over time. Nevertheless, data users are advised to consider the factors related to registration techniques that may lead to artefactual differences. The primary purpose of this chapter is to describe variations between the cancer registries included in CI5 Volume XI – including variations in populations, the methods used to collect data on new cases, and the sources of data accessed.

All contributors were required to complete an online questionnaire to provide descriptive information about their registry. For each registry, information was collected about the nature and size of the geographical area covered, the reporting facilities and data sources, the procedures for case finding and data abstraction, the coding methods, the type of data collected on incident cases, and the methods of follow-up for vital status. The information provided by each registry included in this volume is tabulated in Tables 2.1–2.3 at the end of this chapter.

REGISTRY BACKGROUND (TABLE 2.1)

Table 2.1 lists the registries that contributed to this volume (grouped by geographical area) and provides information about several variables that describe each registry's characteristics, population size, and some basic aspects of operation. The significance of each variable included in Table 2.1 is described here.

Population: The size of the total population at risk on which a rate estimate is based influences the accuracy of that estimate. Rate estimates based on small numbers of individuals are more susceptible to the effects of random variation than are estimates based on large populations. Summary information about each cancer registry is provided later in this volume, along with the age distribution of the estimated populations at risk and the specific sources of the population data. These are usually official sources such as census data, and projections based on information about birth, death, and migration rates. Estimates tend to be more accurate for years closer to a census, and estimates based on interpolations between censuses tend to be more accurate than are projections based only on the previous census. The estimated populations for each registry, listed in Table 2.1, are the estimated average total populations (rounded to the nearest 1000) covered during the reporting period (generally 2008–2012, although some registries provided data for a shorter time period).

Surface area (km^2)* and *Population in urban area (%): Cancer registries or registry networks in more-developed countries, such as the National Program of Cancer Registries (NPCR) and the Surveillance, Epidemiology, and End Results (SEER) Program in the USA, may cover very large geographical areas – entire provinces, states, or countries – whereas the covered populations in less-developed countries are often limited to urban centres. This is due to well-recognized difficulties with the diagnosis and enumeration of cancer cases in rural settings, in particular if the data collection relies on paper-based data sources. Although the calculated incidence rate for an urban area may be a reasonable estimate of the true rate in that community, the rate may not be representative of the entire country in which the registry is located, because lifestyles in rural and urban populations may be very different. In contrast, some of the registries that cover the largest surface areas are those with very low population density, for example in Australia or Saudi Arabia, as well as those near the Arctic Circle, including parts of Canada, the Arkhangelsk region in the Russian Federation, and Alaska in the USA.

Latitude: The incidence rates of some cancers vary with latitude. This variation may provide evidence of the role of ultraviolet radiation (sunlight) in the etiology of certain cancers; however, similar variations in the rates of other cancers remain unexplained. Information about latitude is provided in Table 2.1 for those interested in investigating this phenomenon further.

Year registry started* and *Year population-based data first available: Developing a highly complete and accurate cancer registry takes time, and data from recently established registries should therefore be interpreted with some caution. Rates may be underestimated due to incomplete registration. Alternatively, during the early years of data collection, prevalent cases (especially from death certificate diagnosis) may be erroneously included as new incident cases, resulting in the overestimation of incidence rates.

Cancer reportable (yes or no): Legislation or administrative orders making cancer a reportable disease and requiring the reporting of cancers to a registry do not guarantee completeness of reporting. Conversely, the absence of such reporting requirements does not necessarily prevent complete case finding. However, laws or rules requiring reporting generally do enhance registry operations, by ensuring access to (or reporting from) all facilities that diagnose or treat cancer, including those in the private sector. Of the 328 registries in CI5 Volume XI that provided this information, cancer reporting was included in legislation (L) in 144 (44%) and was regulated by an administrative order (A) in 61 (19%).

Privacy regulations apply (yes or no): An increasing number of registries must operate under privacy regulations that govern the confidentiality of all patient-level data they handle. Such regulations may affect both the ease with which registries can collect data and their ability to share their data with the research community.

Non-residents treated inside registration area (%)* and *Estimated cases missed because of problems accessing data sources (%): When a registry catchment area has a well-reputed cancer care centre that provides treatment and diagnosis to the population, the number of non-residents treated in the area may be higher than usual. If these non-resident cancer cases are included in the cancer registry database, local rates may be overestimated. Conversely, if there is a cancer centre within reasonable travelling distance outside of a catchment area, that area's rates may be underestimated.

Screening programmes (and starting years, if available): The final five columns of Table 2.1 indicate the starting years of population-based screening programmes for breast, cervical, colorectal, prostate, and oral cancers within the registration areas. These dates are important to consider because the accelerated detection of prevalent cases can inflate incidence estimates, especially during the early years of screening programmes. The abbreviation "NA" (for "not applicable") indicates that a programme does not yet exist in the area.

CASE FINDING, ABSTRACTING, AND CODING (TABLE 2.2)

Table 2.2 lists the usual data sources (primarily diagnostic and clinical facilities) from which cases are identified by each participating cancer registry, and which therefore serve as the basis for the information that is abstracted and recorded by the registry. The most important of these sources are typically pathology laboratories (used in all registries except 17 in China, Japan, Latvia, and Poland), hospital records (from both public and private hospitals), and death certificates. Public hospital inpatient records are used as a data source in 94% of cancer registries, and private hospital inpatient records are available to 80% of registries. Together, these sources can provide a reasonably high level of reporting. However, access to records from radiotherapy and oncology departments, hospital discharge records, imaging facilities, and haematology laboratories can also be important. Some registries also obtain information from hospices and palliative care services, outpatient departments, general practitioners, and health insurance companies. In low- and middle-income countries, there is still a major lack of availability of death certificates, mostly because of the low quality of mortality statistics in general. Of the 328 registries in CI5 Volume XI that provided this information, 272 (83%) had access to death certificates on cancer deaths, and 262 (80%) had access to all death certificates from the registration area.

Information from autopsy services is also used by some registries, but the inclusion of cases identified as incidental findings at autopsy may spuriously increase incidence rates. However, with autopsy becoming an increasingly infrequent routine procedure, this source of error is likely to be minor. About 55% of the registries in CI5 Volume XI used autopsy services as a data source.

In general, the more sources used for case finding, the more complete and accurate the reporting; significant omissions may raise concerns that case finding is incomplete. For example, the absence of any information from radiotherapy facilities would likely be due to a lack of such facilities in the registration area, which might therefore suggest that some cases are missed because patients must go outside the registration area for care. However, the unavailability of some sources does not necessarily indicate underregistration; for example, the absence of private hospital information in a country with universal public health care may not affect registration. The use of multiple sources of case finding requires efficient record matching and de-duplication procedures to ensure that all records pertaining to the same case are brought together in a single registration, so that multiple recordings of the same cancers do not lead to the overestimation of incidence rates.

TYPES OF INFORMATION RECORDED (TABLE 2.3)

Table 2.3 indicates whether certain patient-level variables are recorded by each of the cancer registries included in CI5 Volume XI, which may be of interest to researchers wishing to conduct studies in collaboration with the registries. For example, only about one fifth of the registries record unique identifying (ID) numbers (such as national identity numbers, social security numbers, or national health insurance numbers), and this can be very useful for record-linkage studies. Some registries are required to use ID numbers as an alternative to storing patient names (or addresses) in their databases. The other patient-level variables included in Table 2.3 are ethnic group (or race/colour), stage of disease at diagnosis (for selected cancers), and nature of the initial clinical treatment received. Of the 328 registries, 177 (54%) record stage for all cancer sites, whereas 86 (26%) record stage only for selected sites. More detailed studies have shown that even if stage is recorded, this data item is usually quite incomplete.

More than 60% of registries record information on initial treatment.

The most basic patient-level variables (which are nearly always collected by high-quality population-based registries) are not included in Table 2.3, because they can be assumed to be recorded by all registries in this volume. These universally recorded variables include name, sex, date of birth (or age), permanent residential address, incidence date (usually the date of diagnosis, hospitalization, or first treatment), and primary site and histological type of the cancer diagnosed – preferably coded according to the *International Classification of Diseases for Oncology* (ICD-O) schema (see Chapters 3 and 4).

Table 2.3 also indicates whether there is systematic vital status follow-up of registered patients. This is essential for registries wishing to conduct survival analysis. Information is also provided about whether follow-up is carried out passively (by access to death certificates) and/or by active follow-up of live cases. Systematic vital status follow-up was done by 95% of registries, by either passive or active follow-up, or a combination of the two.

The last two columns of Table 2.3 indicate whether each registry follows any standard rules for recording incidence data and whether each registry can reliably identify subsequent primary cancers diagnosed in an individual previously diagnosed with an initial primary. Incidence date definitions in use were those of IARC/IACR (49% of registries included in this volume), the European Network of Cancer Registries (ENCR) (23%), and SEER (17%). Some of these recorded variables can provide information relevant to the care of cancer patients and the outcome of disease but are not used in this publication. If required for a specific research study, the data must be obtained from the individual registries.

Table 2.1. Background information on the registries included in CI5 Volume XI

Chapter 3: Classification and coding

Jacques Ferlay, Klaus Kraywinkel, Brian Rous, and Ariana Znaor

The *Cancer Incidence in Five Continents* (CI5) series has followed the evolution of the *International Classification of Diseases* (ICD) through four revisions, from the seventh revision (ICD-7) to the tenth (ICD-10), and the creation of a coding scheme for oncology: the *International Classification of Diseases for Oncology* (ICD-O) (WHO, 1976), now in its third edition (ICD-O-3) (Fritz et al., 2000). CI5 Volumes I (Doll et al., 1966) and II (Doll et al., 1970) presented data on cancer incidence coded to ICD-7 (WHO, 1957). Volume III (Waterhouse et al., 1976) published data using both ICD-7 and ICD-8 (WHO, 1967). ICD-8, which came into effect in 1968, was also used in Volume IV (Waterhouse et al., 1982). ICD-9 (WHO, 1977) was used for Volumes V (Muir et al., 1987), VI (Parkin et al., 1992), and VII (Parkin et al., 1997). ICD-10 (WHO, 1992) was used for Volumes VIII (Parkin et al., 2002), IX (Curado et al., 2007), and X (Forman et al., 2014).

The updates to ICD-10 (2010 version; available from https://www.who.int/classifications/icd/icd10updates/en/) and the 2011 revision of ICD-O-3 (WHO, 2013) were considered in this volume, which presents data for the 5-year period of 2008–2012. The data are published at the level of the three-character ICD-10 codes in the individual registry tables. The groupings of ICD codes adopted in the previous three volumes have been used again in this volume to maintain comparability over time. Table 3.1 presents the individual ICD-10 site codes, the full ICD-10 titles, the Volume XI groupings, and the short titles used in the incidence tables.

UPDATES OF ICD-10 AND ICD-O-3

The update of ICD-10 introduced in 2010 resulted in changes for the neoplasm chapter that affected the "Malignant neoplasms, stated or presumed to be primary, of lymphoid, haematopoietic and related tissue (C81–C96)" group. Mainly, a new three-digit category C86 "Other specified types of T/NK-cell lymphoma" and several new four-digit codes were added to the existing ones, in particular the new code C88.4 "Extranodal marginal zone B-cell lymphoma of mucosa-associated lymphoid tissue [MALT-lymphoma], Lymphoma of skin-associated lymphoid tissue (SALT-lymphoma), and Lymphoma of bronchial-associated lymphoid tissue (BALT-lymphoma)". These diagnoses were previously included within the ICD-10 (1990) category C82.7 in CI5 Volume X. The 2011 revision of ICD-O-3 affected the morphology numerical list only, introducing new terms that have appeared in the recent literature, particularly in the "Lymphoma and leukaemia" group. Therefore, a new conversion table from the first (2011) revision of ICD-O-3 to ICD-10 (2010 version) for the ICD-O-3 morphology codes 9590/3 to 9992/3 had to be developed (see Table 3.2).

CLASSIFICATIONS USED IN THE CANCER REGISTRY

Data submitted for the first four volumes of CI5 were sent in tabular format – organized by sex, site, and 5-year age group – on tape, diskette, or (most commonly) forms specifically designed for the purpose. The only verification possible was to tally the columns and rows. For Volume V, registries were given the option of sending data in the form of a case listing coded to ICD-9 topography only, or to ICD-9 or ICD-O topography plus ICD-O morphology. Only a very small minority of registries sent data coded to ICD-O. Contributors to Volume VI were encouraged to send data as a listing of individual cases, but 24% still sent tabulated data. Starting from Volume VII, data had to be sent as a listing of individual cases. Since the publication in 1976 of the first edition of ICD-O – which clearly defined axes of anatomical location, histology, and behaviour – international conformity to standard classification systems and coding rules has increased steadily. For data published in Volume IV (1973–1977), 90% of registries recorded histological diagnosis. For coding, just more than one third of the registries used the American Cancer Society's *Manual of Tumor Nomenclature and Coding* (MOTNAC) (ACS, 1951, 1968), one third had started to use ICD-O, and 12% used the *Systematized Nomenclature of Pathology* (SNOP) (CAP, 1965). About 75% of contributors to Volume V used ICD-O to code histology, and that proportion rose to more than 90% for Volumes VI and VII. A total of 182 of the 186 contributors to Volume VIII, 224 of the 225 contributors to Volume IX, 288 of the 290 contributors to Volume X, and all of the contributors to the present volume coded their histological data to ICD-O. Although most of the data submitted for this volume had been coded or converted to ICD-O-3 (see Chapter 6), registries were also asked what classification systems were used for coding data in the registry during the period. Of the 343 contributors, 326 registries (95%) coded to ICD-O topography and morphology (of which 319 used ICD-O-3), and 17 registries (5%) coded to ICD-10 topography and ICD-O morphology.

COMPARABILITY

All data supplied for this volume either were already coded to ICD-O-3 when submitted, or were converted

by IARC to ICD-O-3 for checking and were then converted to ICD-10 for presentation (see Chapter 6). This process ensures that the same validity checks and multiple primary rules are applied to all data, and that the final ICD-10 codes used in this publication follow a standard ICD-O-3 to ICD-10 (2010 version) conversion. When a data set included an ICD-10 code, this was ignored in the tabulations. The ICD-O-3 to ICD-10 conversion program was written at IARC using the rules of the ICD-O-2 to ICD-10 conversion program developed by Percy (1998). The conversions strictly follow the ICD-10 coding rules, as expressed in the instruction manual of ICD-10 Volume 2 (Percy et al., 1990) or in the alphabetical index of ICD-10 Volume 3. For example, the combination of unknown primary site (ICD-O-3 topography C80.9) and fibrosarcoma, not otherwise specified (NOS; ICD-O-3 morphology 8810/3) is converted to C49.9: "Connective and other soft tissues, NOS" in ICD-10 (see ICD-10 Volume 2, page 74).

Theoretically, the use of a standard, well-designed coding system such as ICD should make the analysis and tabulation of comparable results a simple matter. But in practice, it has been a continual exercise in detection for the editors of CI5 to establish exactly how registries code various cancers. For the present volume, registries were asked whether any malignant diagnoses were excluded from their data, and how they coded intraductal carcinoma of breast, NOS; ductal and lobular carcinoma in situ of breast; ovarian cystadenoma of borderline malignancy; borderline tumour of ovary; benign tumours of brain and nervous system; and in situ and unspecified carcinoma of bladder (see Table 3.3).

Non-melanoma skin cancer

The incidence of non-melanoma skin cancer (NMSC) is difficult to assess. These cancers are very common and are rarely fatal, and the completeness of their registration varies widely depending on access to outpatient and general practitioners' records. Most NMSCs are basal cell carcinomas (BCCs) or squamous cell carcinomas (SCCs); other skin cancers are rare. Although some registries record the first occurrence of all NMSCs, others register BCC only, and many do not collect data on either SCC or BCC.

Bladder cancer

The issue of coding non-invasive tumours (taking into account the recorded level of invasion and grade) – and which to include in the tables as "cancer of the bladder" – has long been a subject of debate. In CI5 Volume VI, it was decided, for the sake of geographical comparability, to exclude tumours of benign, in situ, and unspecified behaviour. In principle, the availability of data as individual case listings with histological type and behaviour should make it possible to publish only data on malignant cancer, by excluding diagnoses with any behaviour code other than /3. But when registries were asked about the behaviour codes they used for non-invasive and unspecified diagnoses of malignant bladder cancer for Volume VII, many of them reported that they assigned the behaviour code /3 to both in situ and unspecified diagnoses, making it impossible to distinguish such cases. As a result, the editors decided to accept that non-invasive diagnoses of bladder cancer are generally considered malignant by pathologists; since Volume VII, the bladder cancer rubric (ICD-10 C67) has therefore included the in situ (ICD-10 D09.0) and unspecified (ICD-10 D41.4) categories. In this volume, whenever possible, the inclusion of neoplasms of uncertain or unknown behaviour together with invasive cancers is indicated by a dagger symbol (†) beside C67 in the tables, and a note under the heading "Notes on the data" in the accompanying text. A few registries preferred not to include such cases in their dataset, even when available in the registry, for the sake of continuity over time.

Breast cancer

Intraductal carcinoma, ductal carcinoma in situ (DCIS), and lobular carcinoma in situ of breast are classified in ICD-O-3 as in situ cancers (behaviour code /2). All the registries in CI5 Volume XI collect these diagnoses, and very few code any of these diagnoses as malignant (behaviour code /3) (see Table 3.3).

Ovarian cancer

The registries contributing to this volume were asked how they coded ovarian cystadenoma of borderline malignancy and borderline tumour of ovary. The behaviour codes they reported using are tabulated in Table 3.3. Borderline ovarian diagnoses are classified as non-malignant tumours in ICD-O-3 (behaviour code /1) and are excluded from the tabulations, but a few registries still code them as malignant neoplasms.

Brain and central nervous system

Many registries choose to include benign and unspecified tumours of the brain and central nervous system in their data, because of the potentially serious clinical consequences of these tumours. Before Volume VII, such tumours may therefore have been included in the tables along with cancers of the brain and nervous system. However, the proportion of such cases varies widely between registries, so since Volume VII they are no longer included.

Myeloproliferative disorders and myelodysplastic syndromes

These include records with the ICD-O-3 morphological codes 9950/3, 996_/3, 9971/3, 9975/3, 998_/3, and 999_/3. Only registries that originally coded their data to ICD-O-3 can report such diagnoses, because they were not considered malignant tumours in ICD-O-2 (behaviour code /1). These codes are converted to the ICD-10 codes D45, D46_, and D47_ by the IARC ICD-O-3 to ICD-10 conversion program (except M9966/3, M9967/3, and M9984/3, which are converted to ICD-10 C92.7, C96.7, and C92.0, respectively; see Table 3.2), and are presented in two separate categories in the tables – "Myeloproliferative disorders (MPD)" and "Myelodysplastic syndromes (MDS)" – and also included in the "All sites (C00–96)" category (see Table 3.1).

Table 3.1. Classifications used in the incidence tables in CI5 Volume XI

ICD-10 (2010 version) site code	Full ICD-10 title	Grouping used in tables	Short title used in tables
C00	Malignant neoplasm of lip	–	Lip
C01	Malignant neoplasm of base of tongue	C01–C02 are grouped	Tongue
C02	Malignant neoplasm of other and unspecified parts of tongue		
C03	Malignant neoplasm of gum	C03–C06 are grouped	Mouth
C04	Malignant neoplasm of floor of mouth		
C05	Malignant neoplasm of palate		
C06	Malignant neoplasm of other and unspecified parts of mouth		
C07	Malignant neoplasm of parotid gland	C07–C08 are grouped	Salivary glands
C08	Malignant neoplasm of other and unspecified major salivary glands		
C09	Malignant neoplasm of tonsil	–	Tonsil
C10	Malignant neoplasm of oropharynx	–	Other oropharynx
C11	Malignant neoplasm of nasopharynx	–	Nasopharynx
C12	Malignant neoplasm of pyriform sinus	C12–C13 are grouped	Hypopharynx
C13	Malignant neoplasm of hypopharynx		
C14	Malignant neoplasm of other and ill-defined sites in the lip, oral cavity and pharynx	–	Pharynx unspecified
C15	Malignant neoplasm of oesophagus	–	Oesophagus
C16	Malignant neoplasm of stomach	–	Stomach
C17	Malignant neoplasm of small intestine	–	Small intestine
C18	Malignant neoplasm of colon	–	Colon
C19	Malignant neoplasm of rectosigmoid junction	C19–C20 are grouped	Rectum
C20	Malignant neoplasm of rectum		
C21	Malignant neoplasm of anus and anal canal	–	Anus
C22	Malignant neoplasm of liver and intrahepatic bile ducts	–	Liver
C23	Malignant neoplasm of gallbladder	C23–C24 are grouped	Gallbladder etc.
C24	Malignant neoplasm of other and unspecified parts of biliary tract		
C25	Malignant neoplasm of pancreas	–	Pancreas
C26	Malignant neoplasm of other and ill-defined digestive organs	C26 is included in other and unspecified	
C30	Malignant neoplasm of nasal cavity and middle ear	C30–C31 are grouped	Nose, sinuses, etc.
C31	Malignant neoplasm of accessory sinuses		
C32	Malignant neoplasm of larynx	–	Larynx
C33	Malignant neoplasm of trachea	C33–C34 are grouped	Trachea, bronchus, and lung
C34	Malignant neoplasm of bronchus and lung		
C37	Malignant neoplasm of thymus	C37–C38 are grouped	Other thoracic organs
C38	Malignant neoplasm of heart, mediastinum and pleura		
C39	Malignant neoplasm of other and ill-defined sites in the respiratory system and intrathoracic organs	C39 is included in other and unspecified	
C40	Malignant neoplasm of bone and articular cartilage of limbs	C40–C41 are grouped	Bone
C41	Malignant neoplasm of bone and articular cartilage of other and unspecified sites		
C43	Malignant melanoma of skin	–	Melanoma of skin
C44	Other malignant neoplasms of skin	–	Other skin
C45	Mesothelioma	–	Mesothelioma
C46	Kaposi sarcoma	–	Kaposi sarcoma
C47	Malignant neoplasm of peripheral nerves and autonomic nervous system	C47 is grouped with C49	Connective and soft tissue
C48	Malignant neoplasm of retroperitoneum and peritoneum	C48 is included in other and unspecified	
C49	Malignant neoplasm of other connective and soft tissue	C49 is grouped with C47	
C50	Malignant neoplasm of breast	–	Breast
C51	Malignant neoplasm of vulva	–	Vulva
C52	Malignant neoplasm of vagina	–	Vagina
C53	Malignant neoplasm of cervix uteri	–	Cervix uteri
C54	Malignant neoplasm of corpus uteri	–	Corpus uteri
C55	Malignant neoplasm of uterus, part unspecified	–	Uterus unspecified
C56	Malignant neoplasm of ovary	–	Ovary

Table 3.1. (Contd) Classifications used in the incidence tables in CI5 Volume XI

ICD-10 (2010 version) site code	Full ICD-10 title	Grouping used in tables	Short title used in tables
C57	Malignant neoplasm of other and unspecified female genital organs	–	Other female genital organs
C58	Malignant neoplasm of placenta	–	Placenta
C60	Malignant neoplasm of penis	–	Penis
C61	Malignant neoplasm of prostate	–	Prostate
C62	Malignant neoplasm of testis	–	Testis
C63	Malignant neoplasm of other and unspecified male genital organs	–	Other male genital organs
C64	Malignant neoplasm of kidney, except renal pelvis	–	Kidney
C65	Malignant neoplasm of renal pelvis	–	Renal pelvis
C66	Malignant neoplasm of ureter	–	Ureter
C67	Malignant neoplasm of bladder	–	Bladder
C68	Malignant neoplasm of other and unspecified urinary organs	–	Other urinary organs
C69	Malignant neoplasm of eye and adnexa	–	Eye
C70	Malignant neoplasm of meninges	C70–C72 are grouped	Brain and nervous system
C71	Malignant neoplasm of brain		
C72	Malignant neoplasm of spinal cord, cranial nerves and other parts of central nervous system		
C73	Malignant neoplasm of thyroid gland	–	Thyroid
C74	Malignant neoplasm of adrenal gland	–	Adrenal gland
C75	Malignant neoplasm of other endocrine glands and related structures	–	Other endocrine
C76	Malignant neoplasm of other and ill-defined sites	C76 is included in other and unspecified	
C80	Malignant neoplasm without specification of site	C80 is included in other and unspecified	
C81	Hodgkin lymphoma	–	Hodgkin lymphoma
C82	Follicular lymphoma	C82–C86 and C96 are grouped	Non-Hodgkin lymphoma
C83	Non-follicular lymphoma		
C84	Mature T/NK-cell lymphomas		
C85	Other and unspecified types of non-Hodgkin lymphoma		
C86	Other specified types of T/NK-cell lymphoma		
C88	Malignant immunoproliferative diseases	–	Immunoproliferative diseases
C90	Multiple myeloma and malignant plasma cell neoplasms	–	Multiple myeloma
C91	Lymphoid leukaemia	–	Lymphoid leukaemia
C92	Myeloid leukaemia	C92–C94 are grouped (following ICD-O-3)	Myeloid leukaemia
C93	Monocytic leukaemia		
C94	Other leukaemias of specified cell type		
C95	Leukaemia of unspecified cell type	–	Leukaemia unspecified
C96	Other and unspecified malignant neoplasms of lymphoid, haematopoietic and related tissue	C96 is grouped with C82–C86	
O&U	Other and unspecified	Includes C26, C39, C48, C76, and C80	Other and unspecified
MPD	Myeloproliferative disorders	Includes ICD-O-3 M9950/3, M9960–9965/3, M9971/3, and M9975/3	Myeloproliferative disorders
MDS	Myelodysplastic syndromes	Includes ICD-O-3 M9980–9983/3, M9985–9989/3, M9991/3, and M9992/3	Myelodysplastic syndromes
C00–96*			All sites
C00–96* exc. C44			All sites except C44

*Includes O&U, MPD, and MDS site codes

Table 3.2. Conversion of lymphoid and haematopoietic diseases (ICD-O-3 M9590–M9992)

ICD-O-3 (first revision) code	Full ICD-O-3 title	ICD-10 (2010 version) site code
9590/3	Malignant lymphoma, NOS	C85.9
9591/3	Malignant lymphoma, non-Hodgkin, NOS	C85.9
9596/3	Composite Hodgkin and non-Hodgkin lymphoma	C85.1
9597/3	Primary cutaneous follicle centre lymphoma	C82.6
9650/3	Hodgkin lymphoma, NOS	C81.9
9651/3	Hodgkin lymphoma, lymphocyte-rich	C81.4
9652/3	Hodgkin lymphoma, mixed cellularity, NOS	C81.2
9653/3	Hodgkin lymphoma, lymphocyte depletion, NOS	C81.3
9654/3	Hodgkin lymphoma, lymphocyte depletion, diffuse fibrosis	C81.3
9655/3	Hodgkin lymphoma, lymphocyte depletion, reticular	C81.3
9659/3	Hodgkin lymphoma, nodular lymphocyte predominance	C81.0
9661/3	Hodgkin granuloma	C81.9
9662/3	Hodgkin sarcoma	C81.3
9663/3	Hodgkin lymphoma, nodular sclerosis, NOS	C81.1
9664/3	Hodgkin lymphoma, nodular sclerosis, cellular phase	C81.1
9665/3	Hodgkin lymphoma, nodular sclerosis, grade 1	C81.1
9667/3	Hodgkin lymphoma, nodular sclerosis, grade 2	C81.1
9670/3	Malignant lymphoma, small B lymphocytic, NOS	C83.0
9671/3	Malignant lymphoma, lymphoplasmacytic	C83.0
9673/3	Mantle cell lymphoma	C83.1
9675/3	Malignant lymphoma, mixed small and large cell, diffuse	C85.9
9678/3	Primary effusion lymphoma	C83.8
9679/3	Mediastinal large B-cell lymphoma (C38.3)	C85.2
9680/3	Malignant lymphoma, large B-cell, diffuse, NOS	C83.3
9684/3	Malignant lymphoma, large B-cell, diffuse, immunoblastic, NOS	C83.3
9687/3	Burkitt lymphoma, NOS	C83.7
9688/3	T-cell/histiocyte-rich large B-cell lymphoma	C83.3
9689/3	Splenic marginal zone B-cell lymphoma (C42.2)	C83.0
9690/3	Follicular lymphoma, NOS	C82.9
9691/3	Follicular lymphoma, grade 2	C82.1
9695/3	Follicular lymphoma, grade 1	C82.0
9698/3	Follicular lymphoma, grade 3	C82.2
9699/3	Marginal zone B-cell lymphoma, NOS	C83.0 (C42.0, C42.1, C42.4, C77._) C88.4 (other topography)
9700/3	Mycosis fungoides (C44._)	C84.0
9701/3	Sezary syndrome	C84.1
9702/3	Mature T-cell lymphoma, NOS	C84.4
9705/3	Angioimmunoblastic T-cell lymphoma	C86.5
9708/3	Subcutaneous panniculitis-like T-cell lymphoma	C86.3
9709/3	Cutaneous T-cell lymphoma, NOS (C44._)	C84.8
9712/3	Intravascular large B-cell lymphoma (C49.9)	C83.8
9714/3	Anaplastic large cell lymphoma, T-cell and Null cell type	C84.6
9716/3	Hepatosplenic T-cell lymphoma	C86.1
9717/3	Intestinal T-cell lymphoma	C86.2
9718/3	Primary cutaneous CD30+ T-cell lymphoproliferative disorder (C44._)	C86.6
9719/3	NK/T-cell lymphoma, nasal and nasal-type	C86.0
9724/3	Systemic EBV positive T-cell lymphoproliferative disease of childhood	C84.5
9725/3	Hydroa vacciniforme-like lymphoma	C84.5
9726/3	Primary cutaneous gamma-delta T-cell lymphoma	C84.5
9727/3	Precursor cell lymphoblastic lymphoma, NOS	C83.5*
9728/3	Precursor B-cell lymphoblastic lymphoma	C83.5
9729/3	Precursor T-cell lymphoblastic lymphoma	C83.5
9731/3	Plasmacytoma, NOS	C90.3
9732/3	Multiple myeloma (C42.1)	C90.0
9733/3	Plasma cell leukemia (C42.1)	C90.1

Chapter 4: Histological groups

Jacques Ferlay and Brian Rous

BACKGROUND

The data presented in this volume of *Cancer Incidence in Five Continents* (CI5) cover the period 2008–2012 and are mainly organized by the predominantly site-based categories of Chapter II (Neoplasms) of the 10th revision of the *International Classification of Diseases* (ICD-10, 2010 version; WHO, 2010) (see Chapter 3 of this volume). However, for some sites of cancer, the histological type is particularly relevant clinically and/or epidemiologically. In the present volume, the data are grouped according to histological types as defined in CI5 Volume X (Forman et al., 2014) and listed in this chapter.

GENERAL STRUCTURE

The main structure of the histological grouping is that specific types of malignant neoplasms are listed, as well as the category "Unspecified malignant neoplasm" (i.e. malignant tumours that are so poorly differentiated that we are unable to classify them into major groups such as carcinoma or sarcoma). Neoplasms that have a specific morphology but are too rare to be listed among the major histological groups are grouped together in the category "Other specified malignant neoplasm". Similarly, in the category "Carcinoma", specific subtypes, such as "Squamous cell carcinoma" and "Adenocarcinoma", are listed, as well as "Unspecified carcinoma" (i.e. carcinomas that are so poorly differentiated that we are unable to classify them according to histological subtype, although it is still possible to distinguish them from non-epithelial malignant neoplasms such as sarcoma). Morphological codes are listed for the specific types of neoplasm (or carcinoma), and for "Unspecified malignant neoplasm" (or carcinoma). The remaining codes of neoplasia (or carcinoma) are then automatically assigned to the "Other specified malignant neoplasm" (or carcinoma) category.

SITES

For inclusion in CI5 as a distinct histological type within a site group, a type must be both sufficiently common at the site and clinically epidemiologically relevant. The following 15 organ sites are included in this chapter, with accompanying histological type information: oesophagus, anus, liver, lung, bone, skin, cervix uteri, corpus uteri, ovary, testis, kidney and renal pelvis, urinary bladder, eye, brain and central nervous system, and thyroid, as well as haematological malignancies. Some major cancer sites, such as breast and prostate, are not included, because most malignant neoplasms at these sites are adenocarcinomas, and the coding of adenocarcinoma subtypes is not consistent. Kidney was combined with renal pelvis because some urothelial carcinomas originating from the renal pelvis are site coded as kidney cancers, whereas others are coded as renal pelvis cancers. Hodgkin lymphoma and leukaemias are combined together in the haematological group.

TYPES OF NEOPLASMS INCLUDED

The CI5 Volume XI data include all invasive malignant neoplasms and some non-invasive malignant neoplasms (see Chapter 3). For most morphology codes, a fifth digit of /1 or /2 automatically excludes data entry. Carcinoma in situ is reported by many cancer registries, but is not generally dealt with in this volume, with the exception of urothelial carcinoma in situ. A few lesions of borderline malignancy are included, such as low-grade non-invasive papillary transitional cell tumours, which are now designated as papillary urothelial neoplasia of low malignant potential (PUNLMP) (8130/1). Flat carcinoma in situ of the urothelium (8120/2) and PUNLMP (8130/1, 8130/2) have been grouped with transitional cell carcinoma in this volume. Because skin has been added to the sites, basal cell carcinoma is reported as a separate group, although many cancer registries do not have statistics on these tumours. Within the 15 organ sites presented, there are no cases of mesothelioma (ICD-O M905_), Kaposi sarcoma (9140), lymphoma, or leukaemia (9590–9992), because these cancers have their own specific ICD-10 codes and are presented separately in this volume.

MORPHOLOGY CODES

The grouping of morphology codes presents several difficulties. The ICD-O system is based on separate site (topography) and morphology (histology) codes that can be combined. Inevitably, in cancer registry data, morphology codes are sometimes mistakenly combined with codes for sites where these entities do not occur or have not been reported. Some morphology codes are redundant (i.e. multiple codes can be applied for the same tumour). Other codes are obsolete (i.e. the entities have been renamed or deleted in later revisions of tumour classifications). A major difficulty is the variation in coding precision (specific codes for tumour subtypes vs comprehensive codes for broad categories such as adenocarcinoma), which limits the utility of detailed codes. An example of this is kidney tumours. Renal cell carcinomas are often

coded as renal cell carcinoma, not otherwise specified (NOS) (8312) or adenocarcinoma, NOS (8140), whereas others are subtyped. Therefore, all carcinomas of the kidney are grouped together in this chapter.

Some cancer types occur in several organs but have different clinical behaviour depending on the site of origin. For most sites, adenosquamous carcinoma (8560) and mucoepidermoid carcinoma (8430) are included in the category "Other specified carcinoma". An exception is the corpus uteri (C54), where these are included in the category "Adenocarcinoma" because they are thought to have similar biology (Zaino and Kurman, 1988). Furthermore, squamous differentiation is very common in endometrioid carcinoma (8380–8383), which makes it difficult to differentiate between these tumours. Another example is metaplastic carcinoma (8575), which is generally included in the category "Other specified carcinoma". However, for the corpus uteri, it is included in the category "Other specified malignant neoplasm", because metaplastic carcinoma is considered equivalent to carcinosarcoma at this site (Silverberg et al., 1990).

The "Unspecified carcinoma" category includes tumours that are coded as carcinoma, NOS, but also some descriptive diagnoses of poorly differentiated cancers. These tumours can be recognized as carcinomas but are too undifferentiated to be further classified according to their histogenetic origin. This group generally includes the morphology codes 8010–8035. An exception is the lung, where "Large cell carcinoma" is a separate category in the WHO classification, and includes 8010–8012, 8014–8031, and 8035 (Travis et al., 2004). Another exception is the thyroid, where "Anaplastic carcinoma" is also a specific category in the WHO classification, and includes the morphology codes 8020–8035 (DeLellis et al., 2004).

Some tumours are evidently miscoded in cancer registry data, because their incidence is far higher than expected. Papillary carcinomas, NOS are listed in the category "Squamous cell neoplasm" in ICD-O-3 (Fritz et al., 2000). But most bladder tumours for which this code is used are probably miscoded urothelial carcinomas rather than papillary squamous cell carcinomas, and they are therefore included in the "Transitional cell carcinoma" category. In the thyroid, it can be assumed that carcinomas assigned the morphology code 8050 are actually papillary carcinomas of the thyroid, and they are therefore included in that category. In the kidney, it can be assumed that the majority of tumours with the morphology code 8050 are miscoded papillary renal cell carcinomas, and they are therefore included in the "Renal cell carcinoma" category.

OESOPHAGUS (C15)

The "Adenocarcinoma" category excludes linitis plastica (8142), which occurs in the gastric epithelium. The "Squamous cell carcinoma" category includes basaloid squamous cell carcinoma (8083). The principal cancers in the "Other specified carcinoma" category are large cell carcinoma (8012–8014) and small cell carcinoma (8041–8045). Melanoma and carcinosarcoma are included in the category "Other specified malignant neoplasm".

Table 4.1. Oesophagus (C15)

1 Carcinoma	**8010–8576**
1.1 Squamous cell carcinoma	8050–8078, 8083–8084
1.2 Adenocarcinoma	8140–8141, 8143–8145, 8190–8231, 8260–8265, 8310, 8401, 8480–8490, 8550–8552, 8570–8574, 8576
1.3 Other specified carcinoma	
1.4 Unspecified carcinoma	8010–8035
2 Sarcoma	**8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581**
3 Other specified malignant neoplasm	
4 Unspecified malignant neoplasm	**8000–8005**

ANUS (C21)

The category "Squamous cell carcinoma" includes basaloid and cloacogenic carcinomas (8123–8124) and basaloid squamous cell carcinoma (8083). Cloacogenic carcinoma is a controversial entity, sometimes defined as carcinoma arising from the anal transition zone, and sometimes as a morphological variant of squamous cell carcinoma. The term "basaloid carcinoma" has also been used to designate this group of tumours. Their reported incidence is highly variable, possibly because of the confusing nomenclature. Hence, these tumour types are included in the category "Squamous cell carcinoma".

Table 4.2. Anus (C21)

1 Carcinoma	**8010–8576**
1.1 Squamous cell carcinoma	8050–8076, 8083–8084, 8123–8124
1.2 Adenocarcinoma	8140–8145, 8190–8231, 8260–8265, 8310, 8401, 8480–8490, 8550–8552, 8570–8574, 8576
1.3 Other specified carcinoma	
1.4 Unspecified carcinoma	8010–8011
2 Melanoma	**8720–8790**
3 Other specified malignant neoplasm	
4 Unspecified malignant neoplasm	**8000–8005**

LIVER (C22)

The category "Hepatocellular carcinoma" includes hepatoid carcinomas (8576), under the assumption that these are actually miscoded hepatocellular carcinomas. The category "Cholangiocarcinoma" encompasses all primary carcinomas of the liver of biliary epithelial type (i.e. it excludes hepatocellular carcinoma and combined hepatocellular and cholangiocarcinoma). Combined hepatocellular and cholangiocarcinoma (8180) is included in the "Other specified carcinoma" category, as are carcinoids.

Table 4.3. Liver and intrahepatic bile ducts (C22)

1 Carcinoma	**8010–8576**
1.1 Hepatocellular carcinoma	8170–8175
1.2 Cholangiocarcinoma (all intrahepatic biliary carcinomas, i.e. all primary adenocarcinomas)	8050, 8140–8141, 8160–8161, 8260, 8440, 8480–8500, 8570–8572
1.3 Other specified carcinoma	
1.4 Unspecified carcinoma	8010–8035
2 Hepatoblastoma	**8970**
3 Sarcoma	
3.1 Haemangiosarcoma	9120–9133, 9161
3.2 Other sarcomas	8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9150, 9170, 9540–9581
4 Other specified malignant neoplasm	
5 Unspecified malignant neoplasm	**8000–8005**

LUNG (C34)

The "Squamous cell carcinoma" category includes papillary carcinomas, NOS (8050), because these are listed under "Squamous cell neoplasm" in ICD-O-3. The category "Adenocarcinoma" includes bronchiolo-alveolar adenocarcinoma (8250–8254) but excludes adenoid cystic (8200), mucoepidermoid (8430), and adenosquamous (8560) carcinomas, which are instead included in the category "Other specified carcinoma". The category "Large cell carcinoma" includes cancers so described (8012), as well as other morphological variants of undifferentiated carcinomas (except those with neuroendocrine or spindle cell differentiation) and clear cell adenocarcinoma (8310). The category "Other specified carcinoma" includes non-small cell carcinoma (8046); carcinoid tumours (8240–8245); and adenoid cystic (8200), mucoepidermoid (8430), adenosquamous (8560), and large cell neuroendocrine (8013) carcinomas.

Table 4.4. Lung (C34)

1 Carcinoma	**8010–8576**
1.1 Squamous cell carcinoma	8050–8078, 8083–8084
1.2 Adenocarcinoma	8140, 8211, 8230–8231, 8250–8260, 8323, 8480–8490, 8550–8552, 8570–8574, 8576
1.3 Small cell carcinoma	8041–8045
1.4 Large cell carcinoma (including giant cell, clear cell and large cell undifferentiated carcinoma)	8010–8012, 8014–8031, 8035, 8310
1.5 Other specified carcinoma	
2 Sarcoma	**8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581**
3 Other specified malignant neoplasm	
4 Unspecified malignant neoplasm	**8000–8005**

BONE (C40–C41)

The main categories are "Osteosarcoma", "Chondro-sarcoma", and "Ewing sarcoma". These three groups encompass the same ICD-O entities as groups VIII A–C in the third edition of *International Classification of Childhood Cancer* (Steliarova-Foucher et al., 2005). The "Other specified sarcoma" category includes epithelioid sarcoma (8804), fibrosarcoma (8810–8812), malignant fibrous histiocytoma (8830), liposarcomas (8850–8858), angiosarcomas (9120–9133), and malignant giant cell tumours (9250). The "Other specified malignant neoplasm" category includes desmoplastic small round cell tumour (8806), mesenchymoma (8990), chordoma (9370–9372), adamantinomas (9261, 9310), and primitive neuroectodermal tumour (PNET) (9473).

Table 4.5. Bone (C40–C41)

1 Sarcoma	**8800–8921, 9040–9044, 9120–9133, 9150, 9180–9250, 9260, 9540–9581**
1.1 Osteosarcoma	9180–9200
1.2 Chondrosarcoma	9210–9243
1.3 Ewing sarcoma	9260
1.4 Other specified sarcoma	
1.5 Unspecified sarcoma	8800–8803, 8805
2 Other specified malignant neoplasm	
3 Unspecified malignant neoplasm	**8000–8005**

SKIN (C43–C44)

Basal cell carcinoma is registered and reported by several cancer registries, and has therefore been included.

Table 4.6. Skin (C43–C44)

1 Carcinoma	**8010–8576**
1.1 Squamous cell carcinoma	8050–8078, 8083–8084
1.2 Basal cell carcinoma	8090–8098
1.3 Other specified carcinoma	
1.4 Unspecified carcinoma	8010–8035
2 Melanoma	**8720–8790**
3 Other specified malignant neoplasm	
4 Unspecified malignant neoplasm	**8000–8005**

CERVIX UTERI (C53)

Mucoepidermoid carcinoma (8430) and adenosquamous carcinoma (8560) are included in the category "Other specified carcinoma". The "Other specified malignant neoplasm" category includes Mullerian mixed tumour (8950), carcinosarcoma (8980), and melanoma (8720–8790). Malignant endometrioid adenofibroma (8381) is also classified as "Other specified malignant neoplasm".

Table 4.7. Cervix uteri (C53)

1 Carcinoma	**8010–8380, 8382–8576**
1.1 Squamous cell carcinoma	8050–8078, 8083–8084
1.2 Adenocarcinoma	8140–8141, 8190–8211, 8230–8231, 8260–8265, 8310, 8380, 8382–8384, 8440–8490, 8570–8574, 8576
1.3 Other specified carcinoma	
1.4 Unspecified carcinoma	8010–8035
2 Sarcoma	**8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581**
3 Other specified malignant neoplasm	
4 Unspecified malignant neoplasm	**8000–8005**

CORPUS UTERI (C54)

Squamous cell carcinomas are included in the category "Other specified carcinoma" because of their rarity at this site. Unlike for other sites, mucoepidermoid (8430) and adenosquamous (8569) carcinomas are included in the category "Adenocarcinoma", because squamous differentiation is very common in adenocarcinoma of the corpus uteri, and it is assumed that partial squamous differentiation does not change the behaviour of these neoplasms. Also, unlike for other sites, metaplastic carcinoma (8575) is included in the category "Other specified malignant neoplasm", because in the corpus uteri, metaplastic carcinoma of the endometrium has been equated with carcinosarcoma.

Table 4.8. Corpus uteri (C54)

1 Carcinoma	**8010–8574, 8576**
1.1 Adenocarcinoma (including mucoepidermoid and adenosquamous carcinoma)	8140–8141, 8190–8211, 8230–8231, 8260–8265, 8310, 8380, 8382–8384, 8430, 8440–8490, 8510, 8560, 8569, 8570–8574, 8576
1.2 Other specified carcinoma	
1.3 Unspecified carcinoma	8010–8035
2 Sarcoma	**8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581**
3 Other specified malignant neoplasm	
4 Unspecified malignant neoplasm	**8000–8005**

OVARY (C56)

The first four carcinoma categories listed here correspond to malignant serous, mucinous, endometrioid, and clear cell tumours. Among the carcinomas not included in these four groups, there are various adenocarcinomas that cannot with certainty be allocated to any of the above-mentioned groups, and are hence included in the category "Adenocarcinoma, NOS". This category also includes papillary adenocarcinoma (8260), cystadenocarcinoma (8440), and other variants of adenocarcinoma. Within the category "Adenocarcinoma, NOS", there are probably a substantial number of tumours that actually belong to categories 1.1–1.4. Truly unclassified adenocarcinomas of the ovary are uncommon. Sex cord-stromal tumours have their own group. The category "Germ cell tumours" includes dysgerminomas, embryonal carcinomas, and teratomas, as well as the rare carcinoid tumours of the ovary, and the very rare gonadoblastomas. Lipid cell tumours, malignant Brenner tumours, and sarcomas are very rare and are consigned to the category "Other specified malignant neoplasm".

Table 4.9. Ovary (C56)

1 Carcinoma	**8010–8231, 8246–8576, 9014–9015, 9110**
1.1 Serous carcinoma	8441, 8460–8463, 9014
1.2 Mucinous carcinoma	8470–8490, 9015
1.3 Endometrioid carcinoma	8380–8383, 8560, 8570
1.4 Clear cell carcinoma	8310–8313, 9110
1.5 Adenocarcinoma, NOS	8140–8147, 8170–8190, 8211–8231, 8260, 8384, 8440, 8576
1.6 Other specified carcinoma	
1.7 Unspecified carcinoma	8010–8035
2 Sex cord-stromal tumours	**8590–8671**
3 Germ cell tumours	**8240–8245, 9060–9102**
4 Other specified malignant neoplasm (including Mullerian mixed tumour, carcinosarcoma)	
5 Unspecified malignant neoplasm	**8000–8005**

TESTIS (C62)

Spermatocytic seminoma has a more favourable prognosis than does seminoma, and these tumours should not be grouped together. Embryonal carcinoma, malignant teratoma, yolk sac tumour, choriocarcinoma, and mixed germ cell tumours are included in the category "Non-seminomatous germ cell tumours". Sex cord-stromal tumours are included in the category "Other specified malignant neoplasm".

Table 4.10. Testis (C62)

1 Germ cell tumours	**9060–9102**
1.1 Seminoma	9060–9062, 9064
1.2 Spermatocytic seminoma	9063
1.3 Non-seminomatous germ cell tumours	9065–9102
2 Other specified malignant neoplasm	
3 Unspecified malignant neoplasm	**8000–8005**

KIDNEY (C64) AND RENAL PELVIS (C65)

There are several major difficulties with the histological grouping of kidney tumours. Transitional cell and squamous carcinomas in the kidney usually originate from the renal pelvis, although it may be difficult to trace the origin of the tumour. It can be assumed that some of these are site coded kidney (C64) and others renal pelvis (C65). Hence, these two sites are now grouped.

Renal cell carcinomas have recently undergone a reclassification based on molecular, cytogenetic, morphological, and clinical data. However, a substantial portion of these tumours are coded as renal cell carcinoma, NOS (8312) or adenocarcinoma, NOS (8140), whereas others are subtyped. Therefore, the "Renal cell carcinoma" category includes adenocarcinoma, NOS (8140), specific subtypes of renal cell carcinoma, and also obsolete entities such as granular cell carcinoma (8320). Papillary carcinoma, NOS (8050) is listed under "Squamous cell neoplasm" in ICD-O-3. When this code is used for renal tumours, it is probably most often a miscoding of papillary renal carcinoma, and it is therefore included in the "Renal cell carcinoma" category as well.

Table 4.11. Kidney (C64) and renal pelvis (C65)

1 Carcinoma	**8010–8576**
1.1 Squamous, transitional cell carcinoma	8051–8084, 8120–8122, 8130–8131
1.2 Renal cell carcinoma	8050, 8140, 8260, 8270, 8280–8312, 8316–8320, 8340–8344
1.3 Other specified carcinoma	
1.4 Unspecified carcinoma	8010–8035
2 Other specified malignant neoplasm	
3 Unspecified malignant neoplasm	**8000–8005**

URINARY BLADDER (C67)

The classification of urinary bladder tumours has undergone several revisions in recent years. Some low-grade papillary transitional cell tumours are now designated as PUNLMP (8130/1). To enable longitudinal comparisons, flat carcinoma in situ (8120/2) and PUNLMP (8130/1, 8130/2) have been included in the category "Transitional cell carcinoma".

Papillary carcinomas, NOS (8050) are listed under "Squamous cell neoplasm" in ICD-O-3. But when this code is used for bladder tumours, it is probably most often a miscoding of transitional cell carcinoma, and it is therefore included in the "Transitional cell carcinoma" category. Pheochromocytoma, malignant paraganglioma, melanoma, and carcinosarcoma are included in the "Other specified malignant neoplasm" category.

Table 4.12. Urinary bladder (C67)

1	**Carcinoma**	**8010–8576**
1.1	Squamous cell carcinoma	8051–8078, 8083–8084
1.2	Transitional cell carcinoma (including transitional cell carcinoma with squamous and/or glandular differentiation)	8050, 8120–8122, 8130–8131
1.3	Adenocarcinoma	8140–8145, 8190–8231, 8260–8265, 8310, 8401, 8480–8490, 8550–8552, 8570–8574, 8576
1.4	Other specified carcinoma	
1.5	Unspecified carcinoma	8010–8035
2	**Sarcoma**	**8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581**
3	**Other specified malignant neoplasm**	
4	**Unspecified malignant neoplasm**	**8000–8005**

EYE (C69)

The principal eye cancers – retinoblastoma and malignant melanoma – form two categories. The carcinomas are divided into three subgroups: "Squamous cell carcinoma" (70% of the carcinomas, principally tumours of the conjunctiva and cornea), "Other specified carcinoma" (14.6% of the carcinomas, comprising almost entirely adenocarcinomas and mainly originating in the lacrimal gland and duct), and "Unspecified carcinoma". Squamous cell carcinomas that are site coded for the eye (C69) probably include some cancers that originate in the skin (C44) of the eyelids.

Table 4.13. Eye (C69)

1	**Retinoblastoma**	**9510–9513**
2	**Malignant melanoma**	**8720–8790**
3	**Carcinoma**	**8010–8576**
3.1	Squamous cell carcinoma	8050–8078, 8083–8084
3.2	Other specified carcinoma	
3.3	Unspecified carcinoma	8010–8035
4	**Sarcoma**	**8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581**
5	**Other specified malignant neoplasm**	
6	**Unspecified malignant neoplasm**	**8000–8005**

BRAIN AND CENTRAL NERVOUS SYSTEM (C71–C72)

These categories are based on those of the WHO *Pathology and Genetics of Tumours of the Nervous System* classification (Kleihues and Cavenee, 1997). Atypical teratoid/rhabdoid tumour (9508) is included in the "Embryonal tumours" category. The "Other neuroepithelial tumours" category includes olfactory, pineal, and some pituitary tumours, such as craniopharyngioma (9350–9352); pinealoma, pineocytoma, and pineoblastoma (9360–9362); papillary tumour of the pineal region (9395); and olfactory neuroepitheliomatous neoplasms (9520–9523).

Table 4.14. Brain and central nervous system (C71–C72)

1 Tumours of neuroepithelial tissue	**8680, 9350–9362, 9380–9508, 9520–9523**
1.1 Gliomas	9380–9384, 9391–9460
1.1.1 Astrocytic tumours	9384, 9400–9421, 9424–9425, 9440–9442
1.1.2 Oligodendroglial tumours and mixed gliomas	9382, 9450–9451
1.1.3 Ependymal tumours	9383, 9391–9394
1.1.4 Gliomas, others	9380–9381, 9423, 9430, 9444, 9460
1.2 Embryonal tumours	9470–9474, 9490, 9500–9504, 9508
1.2.1 Medulloblastoma	9470–9472, 9474
1.2.2 Other	9473, 9490, 9500–9504, 9508
1.3 Other neuroepithelial tumours	
2 Other specified malignant neoplasm	
3 Unspecified malignant neoplasm	**8000–8005**

THYROID (C73)

Follicular and papillary carcinomas constitute the majority of thyroid cancers. The "Papillary carcinoma" category includes follicular carcinomas with a papillary component (8340). It is assumed that most cases of papillary squamous carcinoma (8050) are actually papillary carcinomas, and they are therefore included in this category as well. Squamous carcinoma is no longer recognized as a major histological type in the WHO classification, and it is therefore included in the category "Other specified carcinoma".

"Anaplastic carcinoma" (encompassing undifferentiated, giant cell, and spindle cell carcinomas) is a separate category from "Unspecified carcinoma". Poorly differentiated carcinoma is a controversial entity and has been classified under "Anaplastic carcinoma". Small cell carcinoma (8040–8045) is specifically excluded, because the great majority of tumours previously so diagnosed are in fact lymphomas.

Insular thyroid carcinoma (8337) is a distinctive clinicopathological entity that has been included in the "Other specified carcinoma" category. Mixed medullary-follicular carcinoma (8346) and mixed medullary-papillary carcinoma (8347) are also included in this category.

Table 4.15. Thyroid (C73)

1 Carcinoma	**8010–8576**
1.1 Follicular carcinoma	8290, 8330–8335
1.2 Papillary carcinoma	8050, 8260, 8340–8344, 8350, 8450–8460
1.3 Medullary carcinoma	8345, 8510–8513
1.4 Anaplastic carcinoma	8020–8035
1.5 Other specified carcinoma	
1.6 Unspecified carcinoma	8010-8015
2 Sarcoma	**8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581**
3 Other specified malignant neoplasm	
4 Unspecified malignant neoplasm	**8000–8005**

HAEMATOPOIETIC AND LYMPHOID TISSUES (9590–9992)

The category "Non-Hodgkin lymphoma NOS" is used because some cancer registries lack sufficiently specific data for lineage-based classification.

Table 4.16. Haematopoietic and lymphoid tissues (9590–9992)

1 Hodgkin lymphoma	**9650–9667**
1.1 Nodular lymphocytic predominance	9659
1.2 Classical lymphocyte-rich	9651
1.3 Nodular sclerosis	9663–9667
1.4 Mixed cellularity	9652
1.5 Lymphocytic depletion	9653–9655
1.6 Unspecified	
2 B-cell neoplasms	**9597, 9670–9699, 9712, 9728, 9731–9738, 9761–9764, 9811–9818, 9823–9826, 9833, 9836, 9940**
3 T-cell and NK-cell neoplasms	**9700–9726, 9729, 9827–9831, 9834, 9837, 9948**
4 Myeloid neoplasms	**9840, 9860–9931, 9945–9946, 9950, 9960–9964, 9975, 9980–9989, 9991–9992**
5 Non-Hodgkin lymphoma NOS	**9591**
6 Other specified malignant neoplasms	
7 Unspecified malignant neoplasms	**9590, 9596, 9727, 9760, 9800–9801, 9805–9809, 9820, 9832, 9835, 9965–9967, 9971**

Chapter 5: Data comparability and quality

Freddie Bray and Jacques Ferlay

INTRODUCTION

The utility of a cancer registry is contingent on the underlying quality of its data and the quality control procedures it has in place; the primary function of *Cancer Incidence in Five Continents* (CI5) is to enable the comparison of cancer incidence rates across a multitude of populations worldwide. In the evaluation of registered cases, three dimensions of quality have been assessed to ensure that the registry submissions to this volume meet a sufficiently high standard for inclusion.

Comparability is the extent to which a registry's coding and classification procedures and definitions adhere to established international standards and guidelines. The definition of an incident case is especially important in evaluating comparability.

Completeness is the degree to which all diagnosed neoplasms within a registry's catchment population are included in the registry database. Several methods can be used to evaluate the level of completeness of the enumeration of cases within a catchment population.

Validity (or accuracy) is the proportion of cases recorded as having a given characteristic that truly do have that attribute. Several indicators of validity relate to the precision of a registry's source documents and the level of expertise in abstracting, coding, and recoding cases.

The preparation and evaluation of the indices of data quality for CI5 require careful attention from the volume editors, to ensure that all accepted datasets are of sufficiently high quality to merit their inclusion in the volume. The editorial procedures used to conduct a transparent and impartial evaluation of each submitted dataset are outlined in this chapter.

ELEMENTS OF THE EVALUATION

The practical aspects and techniques of evaluating cancer registry data quality have been examined in a two-part review (Bray and Parkin, 2009; Parkin and Bray, 2009), and were briefly described – with an emphasis on low- and middle-income settings – in IARC Technical Publication No. 43: *Planning and Developing Population-based Cancer Registration in Low- and Middle-income Settings* (Bray et al., 2014). The editorial board of CI5 Volume XI sought to comprehensively assess data quality on the basis of the indicators of comparability, completeness, and validity reported in these publications; in keeping with the approach taken in Volume X (Forman et al., 2014), readers can examine and form their own opinions on the quality of individual datasets by reviewing the accompanying comparative tabulations and graphics in the printed book and online. These tables and figures serve as a guide to evaluating registries' adherence to the standard definitions and recommendations, and the completeness and validity of their data.

As in previous volumes, the editors carried out an extensive process of verifying coding, identifying duplicate registrations, querying unlikely or impossible combinations of codes, and converting the data to a standard format before formal editorial consideration. At the editorial board's meetings, the editors consulted a series of pre-assembled registry-specific tables and other documentation:

- a set of editorial tables (see the examples at the end of this chapter, generated using a hypothetical 2008–2012 dataset for a fictional registration area called *Erewhon*);
- tables of site-specific case numbers, age-specific rates, and summary rates (crude, cumulative, and age-standardized), as presented in this volume;
- the populations at risk by sex and age, including the source or method of estimation used (where applicable), and a comparison with the previous 5-year population data (where available), as presented in this volume; and
- the completed questionnaires, including responses related to the definitions used by each registry.

This review process was routinely applied to the evaluation of most of the 483 datasets submitted, but the increasing number of registries submitting data (including 102 registries in China, 73 of which were submitting data for the first time) also warranted additional comparative overviews of key quality indicators across registries by region and country. As in previous volumes, asterisks are used to denote datasets for which particular consideration is required in interpreting the numerical results for some or all of the reviewed cancer sites (see the *Notes on the datasets* section later in this chapter).

COMPARABILITY

Determining the extent of the comparability of a cancer dataset requires consideration of the registry's procedures, including the standards and definitions used in registration. In the preparation of this volume, the editorial team particularly focused on the following procedural aspects:

- the system used for classifying and coding neoplasms;
- the definition of incidence – what constitutes a cancer case, the definition of date of incidence,

and the rules for dealing with multiple primaries (i.e. for distinguishing new cases of primary cancer from extensions, recurrences, or metastases of existing cases); and
- the registration of cancers detected in asymptomatic individuals.

International standards for the classification and coding of neoplasms

The registries were asked to submit their data coded according to the third edition of the *International Classification of Diseases for Oncology* (ICD-O-3) (Fritz et al., 2000), as well as to verify (and if necessary, to correct) their data before submission. Coding from other systems can be converted to ICD-O-3 using software such as IARCcrgTools (Ferlay et al., 2005).

ICD-O-3 provides a standardized system for coding the following aspects of disease classification:
- **topography:** the anatomical location (body site) of the tumour;
- **morphology:** the microscopic appearance and cellular origin of the tumour;
- **behaviour:** the classification of the tumour as malignant, benign, in situ, or of uncertain behaviour;
- **grade:** the extent of differentiation of the tumour; and
- **basis of diagnosis:** the method of diagnosis used.

Definition of incidence

The CI5 Volume XI call for data specifically requested the submission of data on all primary tumours, including data (if collected) on basal and squamous cell skin cancers and non-malignant tumours of the central nervous system and urinary bladder. The rules for determining incidence date and multiple primaries are briefly described below.

Incidence date: Because the period from the occurrence of the first mutation to the clinical diagnosis of cancer often spans decades, a standardized definition of cancer is needed for determining whether to register a case and establishing the precise date when the disease became incident. Incidence dates are commonly defined using a hierarchical set of rules from one of three available algorithms, published by IARC (Jensen et al., 1991), the European Network of Cancer Registries (ENCR) (Pheby et al., 1997), and the Surveillance, Epidemiology, and End Results (SEER) Program in the USA (Johnson et al., 2007). The registries were asked to state whether one of these algorithms or other, in-house rules were applied.

Multiple primaries: Because an individual may develop more than one cancer, there must be a clear distinction between new cases (to be counted as incident cancers) and cases that are actually extensions, recurrences, or metastases of an existing cancer. There are two sets of rules commonly used by cancer registries for this purpose. The SEER rules (Johnson et al., 2007) are used mainly by cancer registries in North America, whereas the jointly developed IARC/IACR rules (IARC, 2004) tend to be used throughout the rest of the world, at least for the purpose of reporting incidence rates.

The SEER rules result in somewhat higher incidence rates because they allow for the occurrence of multiple incident cancers at the same body site, providing the new case occurs 2 months to 5 years (depending on the site) after an earlier diagnosis, whereas the IARC/IACR rules allow for only one cancer per body site during a patient's lifetime, unless there are multiple cancers of different histological types. The SEER rules also recognize new cases at different subsites of the same organ (e.g. the colon and the skin) or on opposite sides of the body (for paired organs).

Links to these rules were provided to all contributors to this volume. The registries were asked to include all multiple primary tumours in their submitted datasets for the time period covered (2008–2012) and to state which set of rules was used to define new primary cancers, and whether these could be distinguished from subsequent primaries that occur in the same person. The sites at which varying definitions of multiple primaries are likely to have the largest effect on incidence rates are listed in Table 5.1, along with the percentage differences in incidence at these sites (among a subset of SEER registries in the USA) using the SEER definition of a second primary (Johnson et al., 2007) versus the IARC/IACR rules.

Table 5.1. The percentage difference in crude and age-standardized incidence rates (at selected body sites) within the SEER (9 registries) 2008–2012 dataset when determined using the SEER rules for multiple primary tumours versus the IARC/IACR rules (2004)

Body site	Difference in incidence rates using the SEER rules vs the IARC/IACR rules (%)			
	Males		Females	
	Crude	Age-standardized	Crude	Age-standardized
Colon	3.6	3.5	3.6	3.1
Lung	2.0	2.0	2.4	2.5
Skin (melanoma only)	8.7	8.0	5.5	4.9
Breast	–	–	5.9	5.6
Testis	1.8	1.8	–	–
Kidney	3.9	3.9	1.8	1.7
All sites except skin	2.1	2.0	3.2	3.0

Registration of cancers in asymptomatic individuals

Incidental diagnosis is the incidental detection of cancer in an asymptomatic individual (e.g. upon microscopic examination of tissue that has been removed for a reason unrelated to cancer). The incidental diagnosis of cancer occurs with particular frequency as a result of screening examinations and at autopsy.

Screen-detected cancers

When a screening programme is introduced within a population, cancer incidence rates increase, because the programme identifies prevalent cancers that are detectable by the screening test but have not yet progressed to the stage where they begin to cause symptoms. After the initial rounds of screening, these prevalent cases have all been detected, so the incidence rate decreases, but usually not all the way to the pre-screening level, due to some degree of overdiagnosis. This phenomenon occurs when cases are detected that would otherwise not have been diagnosed during a person's lifetime, either because the cancer was so slow-growing that the individual would have died of another cause before the cancer was detected, or because the cancer was non-progressive and would never actually have become invasive. These cancers are sometimes called pseudodisease. Overdiagnosis can occur as a consequence of breast cancer screening, and it is even more common in prostate cancer screening. In both cases, screening (by mammography for breast cancer or by prostate-specific antigen [PSA] testing for prostate cancer) identifies small, slow-growing, latent tumours. Although many of these tumours would never have progressed to clinically significant cancer during the patient's lifetime, it is currently impossible to predict which of them will. Incidence rates are therefore elevated in screened populations. Mammography screening programmes typically target women within the age range of 50–74 years. Men may undergo PSA testing at any age, but it is more common among men older than 50 years.

Almost all cancer registries include malignant tumours that are detected during screening programmes or diagnosed on the basis of histological specimens taken from asymptomatic individuals in whom there was no clinical suspicion of cancer. The inclusion of these cases is likely to increase incidence rates, because at least some of the malignant cells identified in these ways would never have resulted in a clinical cancer diagnosis had they otherwise remained undetected.

Autopsy-detected cancers

Most cancer registries include cases identified during necropsy examinations of subjects in whom cancer had not been diagnosed (or perhaps even suspected) during life. The extent of the resulting inflation of incidence rates depends on the prevalence of necropsy examinations within the population. The impact is greatest in countries and regions with legislation that permits autopsies to be conducted for medical, scientific, or educational purposes without consent. However, such practices have generally been declining in most countries over recent decades.

Application of international standards in low- and middle-income settings

Cancer registries operating in low- and middle-income settings may face particular challenges to following international registration standards (Bray et al., 2014). For example, a lack of coverage by pathology laboratories or difficulty accessing diagnosis records reduces the percentage of microscopically verified cases, and results in postponement of the incidence date as determined according to the ENCR recommendations, which define the incidence date as the date of first histological or cytological confirmation of malignancy.

COMPLETENESS

Completeness – the extent to which all of the incident cancers occurring in the population are included in the registry database – is a very important aspect of data quality. The incidence rates calculated from registry data most closely approximate their true values within the population when maximum completeness is achieved (through the use of comprehensive case-finding procedures). The methods used in the editorial process for this volume to evaluate overall completeness are semiquantitative, in that they provide an indication of the degree of completeness of a given registry's database relative to those of other registries or over time.

The indices of completeness evaluated during the editorial process can be grouped into four categories:

- historical data:
  - the stability of incidence rates (the number of new cases) over time
  - a comparison of incidence rates in different populations
  - age-specific incidence curves
  - childhood cancer incidence rates;
- the proportion of cases microscopically verified (MV%);
- the mortality-to-incidence (M:I) ratio; and
- death certificate methods.

Duplicate registrations of the same case should be avoided through careful attention to record linkage during the registration process. Because the datasets submitted for this volume contained individual anonymous patient identification numbers, it was possible for the editors to check for duplicates (and multiple primaries) according to the IARC/IACR rules (IARC, 2004). However, it was not possible to check for duplicates within a dataset using other data items, which could only be assessed by the individual registries before submission.

Regional comparisons

For several of the quantitative indices described below, a comparison with standard values was performed. In most cases, the standard used for comparison was the values from cancer registries in the same region (or by country when the number of high-quality registries was sufficient), using the data published in the previous two volumes of CI5. Diagnostic practices (especially with respect to histology and cytology) and the accuracy of recording the underlying cause of death on death certificates vary between populations and regions,

but it is reasonable to assume that the incidence rates for specific cancers will tend to be relatively similar in datasets from the same region. In total, 26 regions (or countries) were defined for the purpose of calculating the standard values used to support editorial decisions (see Table 5.2). For each regional group of registries, the data from CI5 Volumes IX and X were used to calculate the mean and variance of the site-specific age-standardized incidence rates, the MV%, and the M:I ratios. Tables listing some of the standard values of MV%, M:I ratio, and age-standardized rate per 100 000 (ASR) that were used in the CI5 editorial process (i.e. those calculated for low- or middle-income countries and regions) are provided in Annex 2 of IARC Technical Publication No. 43 (Bray et al., 2014).

Ad hoc tables were used to identify unusually high or low incidence rates in specific regions – both for all sites combined and for certain major cancers. This helped the editors to assess completeness, by allowing them to identify outliers or unusual patterns.

Table 5.2. The regions defined for calculating standard values of age-standardized incidence rates, proportions of cases microscopically verified (MV%), and mortality-to-incidence (M:I) ratios

		Number of registries in the region
Africa	Sub-Saharan Africa	11
	North Africa and West Asia	13
Central and South America	Central America and the Caribbean	6
	Brazil	5
	South America (excluding Brazil)	14
North America	Canada	12
	USA	13
Asia	China	14
	India	12
	Japan	8
	Republic of Korea	8
	Thailand	6
	Turkey	4
	Other countries in East Asia	4
Europe	Eastern Europe	9
	United Kingdom and Republic of Ireland	12
	Northern Europe	8
	Italy	33
	Spain	13
	South-eastern Europe	7
	France	11
	Germany	9
	Switzerland	9
	Other countries in western Europe	4
Oceania	Australia and New Zealand	9
	Oceania (excluding Australia and New Zealand)	4

Historical data

Stability of the incidence rates (the number of new cases) over time

Changes in the completeness of registration may lead to the appearance of unexpected or implausible incidence trends within a registry's dataset. Therefore, one of the key CI5 editorial tables (Editorial table 1) lists the number of new cases registered by major diagnosis groups per calendar year (and the corresponding percentage of the total number of cases), broken down by sex, with an accompanying bar chart that provides a visual check of the amount of variation in the total numbers of cases per year (at all sites and in both sexes) over the time period covered. At the bottom of each bar, a percentage value indicates how many cases were registered that year relative to the highest number of cases registered in any single year of the covered period. In some cases, this visual check may suggest potential problems with the registration process (or the source population data) during the registration period.

Another editorial table (Editorial table 2) presents, for males and females, average annual incidence rates (per 100 000 person-years) by site and age group, as well

as summary rates. This table also includes a column (with the heading *CHV10*) that lists the estimated annual percentage change in the incidence rates since CI5 Volume X, and the changes that are statistically significant are shown in bold. This incidence rate comparison of CI5 Volumes X and XI, and other comparisons that were performed as part of the editorial process, are described in the *Statistical tests* section later in this chapter. Changes in incidence rates over time that are larger than expected (and that cannot be attributed to discrepancies in the estimation of person-years at risk) suggest the possibility of changes in the completeness of case ascertainment.

Comparison of incidence rates in different populations
The possibility of incomplete registration is also investigated by comparing observed incidence rates with expected values calculated using data from registries in the same region, and an editorial table is generated for this purpose (Editorial table 3). This table presents the age-standardized incidence rates (and their standard errors) for 23 sites (and the total for all sites) in males and females, along with the ratio of the observed value to the expected value (O/E). If the observed age-standardized rate is significantly different from the expected value for the corresponding country or region, the O/E is shown in bold and flagged with a greater-than symbol (>) if the value is higher than expected or a less-than symbol (<) if the value is lower than expected. This comparison and others that were performed as part of the editorial process are described in the *Statistical tests* section later in this chapter. In addition to consulting this editorial table, the editors also frequently compared ad hoc tabulations from registries covering geographically or ethnically similar populations. In some cases, deviation from regional standards may be the result of specific local variations in the prevalence and distribution of risk factors, or in the presence or intensity of screening for certain cancers, but systematic discrepancies (i.e. those seen for several different sites) suggest the possibility of underregistration (or overregistration – e.g. due to the inclusion of duplicate records).

Age-specific incidence curves
As part of the editorial process, age-specific incidence (per 100 000 person-years) curves for 12 sites by sex (Editorial figure 1) were generated and examined to detect any abnormal fluctuations in the anticipated patterns, such as an unexpected drop in the rate of increase in incidence in older age groups, which may be indicative of underascertainment within these groups (although there can also be other explanations). These curves can also reveal problems with the source files used to determine the size of the populations at risk in the various age groups (see also the *Population* section later in this chapter).

Childhood cancer incidence rates
The incidence rates of cancer (all types combined) in children (i.e. within the age groups 0–4 years, 5–9 years, and 10–14 years) tend to exhibit much less variability than do the incidence rates of cancer in adults, although there are some well-documented geographical and ethnic differences for certain childhood cancers. The possibility of underenumeration (and duplicate registration) in this age range within the Volume XI data was investigated by comparing incidence rates within the childhood age groups with the corresponding values from Volume X. The lowest and highest deciles of incidence rates of childhood cancer in the Volume X data are shown in Table 5.3.

Table 5.3. The lowest and highest deciles of incidence rates (per 100 000) of childhood cancer in Volume X

Age group (years)	Boys		Girls	
	Lowest	Highest	Lowest	Highest
0–4	< 12.6	> 26.4	< 12.1	> 23.7
5–9	< 8.9	> 17.9	< 7.0	> 13.0
10–14	< 9.0	> 17.2	< 8.2	> 16.0

Proportion of cases microscopically verified (MV%)
The MV% is the percentage of cases that were diagnosed on the basis of microscopic verification of a tissue specimen (sometimes also called morphological verification – the two terms are synonymous). The definition of microscopically verified cases includes histologically confirmed cases, cases diagnosed on the basis of exfoliative cytology specimens, and cases of leukaemia diagnosed on the basis of haematological examination (without examination of bone marrow). The main use of MV% as an indicator of data quality is as a measure of validity (see the *Validity* section later in this chapter), but a very high proportion of cases diagnosed by histology, cytology, or haematology – higher than might reasonably be expected – may also suggest that a registry is overreliant on pathology laboratories as a source of information and is failing to find cases diagnosed by other means. Editorial table 3 also includes a column showing observed MV% values for 23 sites (and the total of all sites) in males and females. In this MV% column, any observed values that are significantly greater than or less than the expected value (an average for the corresponding country or region) are shown in bold and flagged with a greater-than symbol (>) or a less-than symbol (<), respectively. This comparison is also described in the *Statistical tests* section later in this chapter.

Mortality-to-incidence (M:I) ratio

The M:I ratio is an important indicator of completeness, and its use for this purpose is an example of the independent case ascertainment method of evaluating registry completeness. The M:I ratio compares the number of deaths due to a specific type of cancer over a specific period of time (obtained from a source that is independent of the registry – usually the vital statistics system) with the number of new cases of that type of cancer registered during the same period. When the quality of the mortality data is good (especially in terms of the accuracy of cause of death) and incidence and survival are in steady state, the M:I ratio is approximated by 1 minus the 5-year survival probability. Because both survival and the quality of mortality statistics are somewhat related to the level of socioeconomic development, it is important to consider a registry's geographical location when evaluating this statistic. As part of the CI5 editorial process, the observed M:I ratios for registries' datasets were compared against standard values from the same region, testing for significant differences (see the *Statistical tests* section later in this chapter). Editorial table 3 includes a column showing observed M:I ratios for 23 sites (and the total of all sites) in males and females. Within this column, any observed values that are significantly greater than or less than expected (based on the average regional values from Volume X) are shown in bold and flagged with a greater-than symbol (>) or a less-than symbol (<), respectively.

M:I ratios that are higher than expected raise suspicion of incompleteness (i.e. incident cancers missed by the registry), especially if the values are high for several different sites. However, underreporting or overreporting of tumours on the death certificates distorts this relationship, as does a lack of constancy in incidence and case fatality (the rate of death among incident cases) over time. For example, if incidence increases while case fatality (or survival) remains relatively constant, the M:I ratio tends to be less than (1 minus survival); conversely, if incidence decreases relative to case fatality, the M:I ratio is greater than (1 minus survival), and may even exceed a value of 1 for more lethal cancers.

The use of this method requires mortality data that are of good quality, especially in terms of the accuracy of cause of death. This method cannot be used where there is no comprehensive death registration, or when cause of death is missing or inaccurate on death certificates, which is the situation in almost all countries in Africa and many countries in Asia.

Death certificate methods of evaluating completeness

Access to death certificates is important to cancer registries as a means of finding cases not captured by other registration procedures. The completeness of registration may be evaluated on the basis of the proportion of incident cancers that come to the registry's attention via death certificates. Fig 5.1 illustrates the process of registering new cases using death certificates that mention cancer.

A cancer registry's record linkage procedures should enable the registry to accurately determine whether a death certificate case is already in the database (i.e. previously notified by and registered from another source). A death-certificate-notified (DCN) case is any case first notified by a death certificate. For some DCN cases, the registry later receives a separate notification (without needing to initiate trace-back procedures), and the case is consequently registered from this non-death-certificate source. Because it is possible (depending on registry procedures) for a death certificate mentioning cancer to be received before other relevant notifications (e.g. a pathology report), it has been suggested that registries should establish a suitable interval between receiving a first notification by death certificate and initiating a registration on the basis of this information. If no other notifications are received after this interval, trace-back procedures are initiated. Some cases that are successfully traced back may be found not to be cancers, and are therefore not registered. The remaining cases are classified as death-certificate-initiated (DCI) cases, of which there are two types: (1) successfully traced cases found to be cancers, which are consequently registered from the appropriate source, and (2) cases for which no information source other than a death certificate mentioning cancer can be found, which are consequently registered as death-certificate-only (DCO) cases.

DCO cases represent the residuum of the trace-back process; they are the remaining DCN cases for which no other information source could be obtained through any of the registry's trace-back procedures. By itself, therefore, the proportion of DCO cases (DCO%) is not an indicator of completeness of registration; a low DCO% may indicate efficient case finding or may result from the efficient trace-back of DCN cases. However, the proportion of DCI cases (DCI%) is always greater than or equal to the DCO% (see Editorial table 3), so an elevated DCO% is suggestive of incompleteness.

Like other indicators, the DCO% must be interpreted in the context of local circumstances. In some developing countries, the quality of death certificates may be very poor, with many deaths erroneously attributed to cancer, and registries may have difficulty tracing these notifications back to a hospital capable of confirming (or contradicting) the death certificate statement.

Because death certificate methods rely on the availability of relatively high-quality (complete and accurate) certification of cause of death within the registration area, they are not readily applicable in many low- and middle-income settings, or even in many high-income settings.

VALIDITY

Validity (or accuracy) is defined as the proportion of cases in a dataset recorded as having a given characteristic (e.g. site or age) that truly do have that attribute. Several linked methods are used in this volume to provide numerical indices of validity, which enable (at least on an interval scale) comparisons between registries, within a single registry over time, and within a single registry with respect to specified subsets of cases (cases at certain sites, from different sources, etc.). These methods include internal consistency methods,

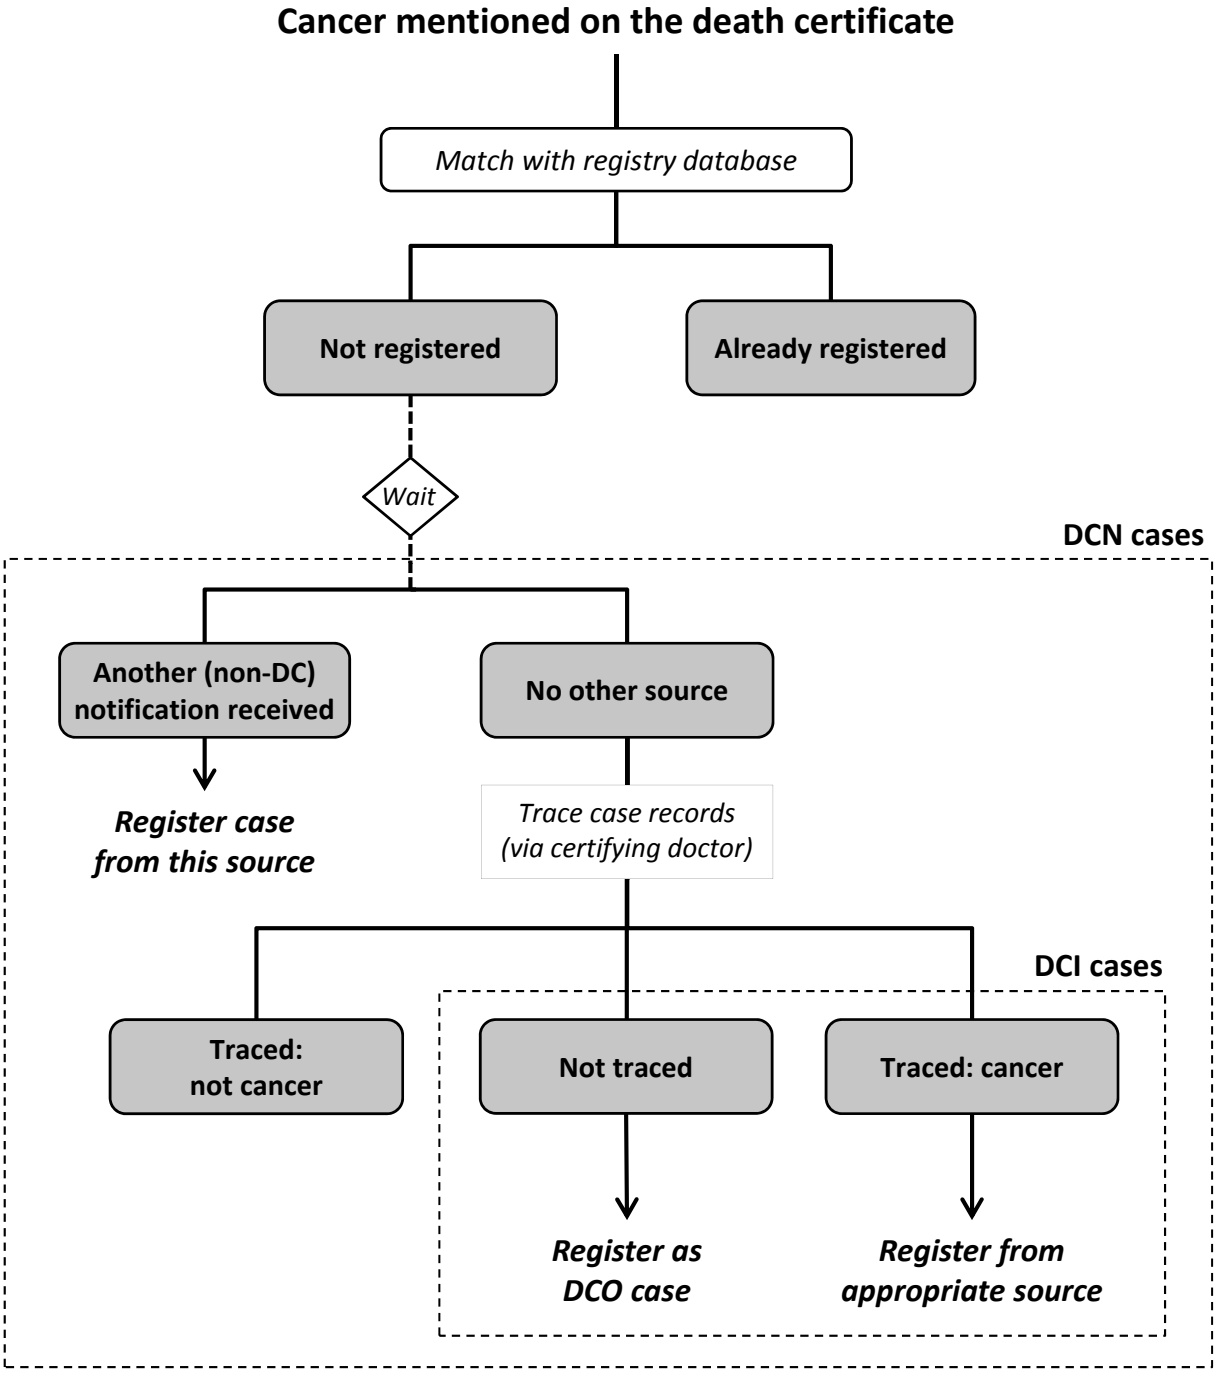

Fig. 5.1. The process of using death certificates (DCs) to identify new cancer cases, which may subsequently be classified as death-certificate-notified (DCN), death-certificate-initiated (DCI), or death-certificate-only (DCO) cases (see the chapter text for more details). Adapted from European Journal of Cancer, 45(5), Bray F and Parkin DM, Evaluation of data quality in the cancer registry: principles and methods. Part I: comparability, validity and timeliness, pages 747–55, Copyright 2009, with permission from Elsevier.

diagnostic criteria methods (histological verification and DCO cases), and missing information analyses (e.g. primary site unspecified, age unknown).

Internal consistency

The use of the IARCcrgTools software to perform consistency checks on the submitted datasets is described in Chapter 6 of this volume. Registries were asked to verify and correct their data using this or other software tools before submission, and to ensure that the ICD-O-3 coding system was used for all relevant variables.

Microscopic verification

Typically, the accuracy of a stated diagnosis is likely to be better if the diagnosis is based on histological

examination by a pathologist. However, surveys have shown that many cancer registries code diagnoses based on exfoliative cytology or haematological examination of peripheral blood in the same category as those based on histological examination (i.e. the cases are all coded as microscopically verified), making it is impossible to distinguish between them in the data. Partly for this reason, the index of validity used in the editorial tables (see Editorial table 3) and the tables showing indices of data quality located at the end of this volume include the MV% rather than the proportion of cases histologically verified (HV%).

As noted in the *Completeness* section above, any observed MV% values in Editorial table 3 that are significantly greater than or less than expected (compared with the regional standard) are shown in bold and flagged with a greater-than symbol (>) or a less-than symbol (<), respectively.

Death-certificate-only (DCO) cases

The proportion of cancers for which no information other than a death certificate mentioning cancer can be found – the DCO% – is another measure of validity, because the information on death certificates is generally less accurate and/or precise than information obtained from clinical or pathology records. A considerable effort has been made in the editorial process to ensure that cases reported as DCO truly are DCO cases. As stated earlier in this chapter, DCO cases represent the residuum of the trace-back process; they are the remaining DCN cases for which no information other than a death certificate mentioning cancer could be obtained through any of the registry's trace-back procedures (see Fig. 5.1). Establishing acceptable and objective criteria for the DCO% has been a contentious issue in international comparative studies. As stated earlier, a low DCO% may simply reflect efficient trace-back of cases initially missed by the normal case-finding procedures. The DCO% is also influenced by local circumstances (including the availability and accuracy of death certificates) and the registry's ability to successfully link records.

Other and unspecified/age unknown

The proportion of registered cases with unknown values for various data items can be an indicator of data quality. Unknown values can result from problems with:

- the data collection system (or access to necessary source documents);
- the item and code values that are defined;
- the application of coding rules.

The definitions used influence the proportion of unknown codes, for example, when evaluating cases with the primary site coded as "Other and unspecified" (O&U). This classification is defined in detail in Chapter 3. Other variables for which the proportion of cases with missing values is commonly evaluated include age, ethnicity, and disease stage. A high proportion of cases with missing values generally implies poor diagnostic precision (as evidenced by the low MV% observed among O&U cases) or a failure to specify the site of the primary cancer in cases diagnosed on the basis of tissue obtained from a metastasis. The proportion of unknown values usually varies by primary site and tends to be higher among elderly patients. The proportions also vary somewhat between registries. The percentages of O&U cases and cases with unknown age, by registry, are shown in Table 5.4 at the end of this chapter.

POPULATION

It is important to remember that a 10% error in the estimation of the population at risk produces the same level of inaccuracy in the calculated incidence rate as a 10% error in enumeration of cases. However, cancer registries are generally not responsible for population estimates, and must rely on official censuses, or intercensal/postcensal estimates provided by vital statistics departments or their equivalents. The editors asked all contributing registries to provide official population estimates and state the source of the population data. This information has been summarized for each registry entry, along with the average annual population at risk during the period covered by the registrations.

Although the population data provided by the registries could rarely be directly verified by the editors, the shapes of the population pyramids, as well as any irregularities in the age-specific incidence curves, were used to identify potential errors in the population estimates (Editorial table 2), and if necessary, the appropriateness of the source of the information provided was queried. Potential problems with estimating the population at risk are stated in the *Notes on the data* section of each entry. In some cases, a high likelihood of inaccuracy in estimates of the population at risk contributed to the editorial decision to mark a registry's contribution with an asterisk.

NOTES ON THE DATASETS: THE ASTERISKS (*)

The presence of an asterisk indicates that additional care is required in interpreting the numerical results for some or all cancer sites; readers should refer to the *Notes on the data* section of the corresponding registry entry for the specific reasons. The principal use of the asterisks is to denote datasets that are considered by the editors to have characteristics suggesting questionable quality or completeness of information on cases or the population at risk, as well as datasets for which the editors could not evaluate the relevant indices because of deficiencies in the registration process. The criteria used in this judgement were not rigidly defined; the decision was based on an examination of all the indices described in this chapter and knowledge of the circumstances within which the registry operates. The intrinsic value of a given dataset in providing information on little-known geographical and ethnic patterns, as well as continuity with earlier data from the same registry, were also taken into consideration. For the purpose of comparability between registries, all datasets for which no official mortality data could be provided or that included no DCO registrations (because of lack of access to death certificates) were also flagged with an asterisk.

STATISTICAL TESTS

Four comparisons (for which statistical tests were applied) were made as part of the editorial process for CI5 Volume XI:

- a comparison of each age-standardized incidence rate with the corresponding value from Volume X;
- a comparison of each registry's age-standardized incidence rates for major sites with the corresponding Volume X values for registries in the same country or region;
- a comparison of each registry's MV% values for major sites with the corresponding Volume X values for registries in the same country or region; and
- a comparison of each registry's M:I ratios for major sites with the corresponding Volume X values for registries in the same country or region.

The results of these tests were not published but have been used to flag certain registry datasets as unusual or possibly inconsistent with previously published data, and therefore requiring further investigation. This battery of tests was first implemented in Volume VIII, and the methodological details and formulae are provided in Chapter 5 of that volume (Parkin and Plummer, 2002).

Mortality data: official statistics.
A detailed description of the statistical tests used can be found in the *Comparability and quality of data* chapter (page 72) of Volume VIII.

Chapter 6: Data processing

Murielle Colombet, Sébastien Antoni, and Jacques Ferlay

The call for data for Volume XI of *Cancer Incidence in Five Continents* (CI5) was launched in June 2015. The call included detailed instructions about the content and format of the material to be submitted, and was disseminated to 596 identified cancer registries worldwide and posted on the website of the International Association of Cancer Registries (IACR). Registries wishing to submit data for inclusion in CI5 Volume XI were asked to provide cancer incidence and mortality data, population data, a 350-word introductory text (narrative), a completed questionnaire, a coding schema, and other relevant information.

DATA FLOW

Registries were asked to submit all material via the Registries Portal, at a secure website (https://cinportal.iarc.fr/; Steliarova-Foucher et al., 2015). The portal is equipped with a series of programs that enable the automatic exchange of information between the cancer registries and the Section of Cancer Surveillance (CSU) at IARC. Based on each registry's access credentials and the submitted data file type, uploaded files were automatically named and stored in an organized system of folders on an internal server at IARC. The submitting registry and the designated CSU staff members were notified of each submission by an automatically generated email. Throughout the process, the registries could review their submissions and manage their uploaded files at any time.

The portal was also used for communication between IARC and potential contributors during the editorial process. Requests for data correction, table revision, or supplementary information, as well as decisions about registries' inclusion in the volume, were communicated through the portal. The relevant files were uploaded to the registry-specific *Feedback* section of the portal, where the registries could retrieve the files after being notified by an automatically generated email. The registries could then submit their responses and any revised or supplementary data in the same way as their initial material. A log of the files' movements on the IARC server was monitored by CSU.

Most of the invited registries submitted and exchanged data through the secured Registries Portal, but a few registries still submitted zipped files by email. A schematic representation of the overall flow of data and processing steps is shown in Fig. 6.1.

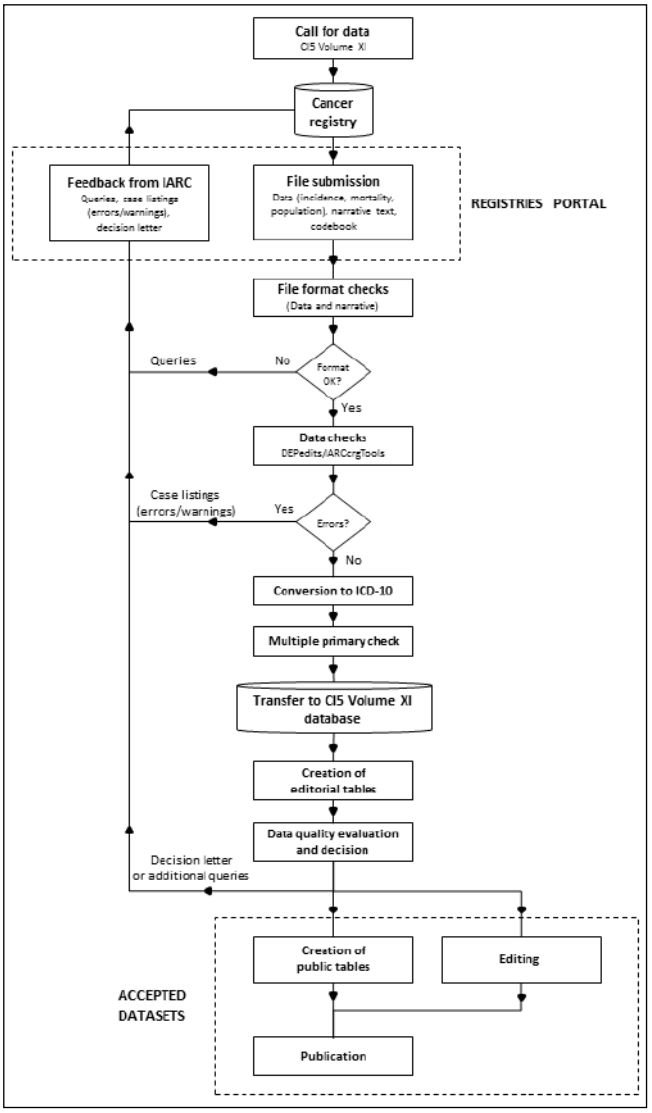

Fig. 6.1. A schematic representation of the overall flow of data and processing steps in the creation of Volume XI of *Cancer Incidence in Five Continents*.

DATA PROTECTION

All raw, individual-level data collected for CI5 Volume XI were stored on a secure protected server at IARC, to which only a limited number of selected CSU staff members had access. These data will not be used for any other purpose or transferred to any third party without the registries' explicit permission.

DATA PROCESSING

A total of 483 cancer registries submitted data in response to the invitation to participate in CI5 Volume XI. Although the preferred file formats were specified in the study protocol, data were received in several electronic formats (text files, spreadsheets, database files, etc.), with varying layouts. The first step of data processing therefore included a quick check of the files' contents (sometimes resulting in a request for additional material), as well as some reorganization and formatting.

About 100 million individual cancer records were received and processed by IARC. The largest dataset, with about 22 million records, was supplied by the National Program of Cancer Registries (NPCR) of the USA. Coupled with mortality files, preliminary datasets representing 663 populations (including various ethnic groups) were produced and reviewed by the editors (see Chapter 5). All submitted data were processed and checked by IARC using automated in-house processes based on standard measures of data quality.

The IARC software package IARCcrgTools (Ferlay et al., 2005; available from http://www.iacr.com.fr/) was used to check and convert the data. All programs used to process, check, and convert the data and create the tables were written in Stata, R, and C++.

Incidence data

Registries were asked to submit their incidence data as individual anonymized case listings including all malignant tumours and non-malignant tumours (except benign tumours) of the bladder, collected for the longest period possible, and to include incident diagnoses for a minimum of 3 consecutive years within the period of 2008–2012. Each record contained at least the following variables:

1. A registration number that uniquely identified the patient
2. Sex
3. Ethnic group or race (optional)
4. Birth date and/or age at incidence date
5. Incidence date
6. Tumour site (topography)
7. Tumour morphology
8. Tumour behaviour
9. Most valid basis of diagnosis.

Descriptions of the codes used for each variable were also required. However, it was not unusual for code values not to match the descriptions provided, or for coding information to be missing. In such cases, the registry was asked for clarification and to provide the correct codes if necessary. This was particularly important for calculating the percentage of microscopically verified or death-certificate-only (DCO) cases, for evaluating the important indicators of data quality influencing the decision to include a dataset in the volume, and for determining the potential designation of data with an asterisk.

CONVERSION TO ICD-O-3

Although 95% of the registries (462/483) submitted data already coded to ICD-O-3 (Fritz et al., 2000) or to the 2011 revision of ICD-O-3 (WHO, 2013), 21 datasets had to be converted to ICD-O-3 before they could be processed by the program. The alternative coding systems used were ICD-10 (WHO, 1992) when the death-certificate-only cases were supplied separately as a case listing, ICD-O-2 (Percy et al., 1990), and for 17 registries, combinations of ICD-10 (WHO, 1992) topography with ICD-O morphology, including the 4.5 million individual records supplied by the 9 cancer registries in England. Conversion from ICD-10 combined with ICD-O required partitioning of the original file into two files; each was then converted to ICD-O-3 separately using the appropriate program, and then merged. These preliminary conversions helped to detect incompatibilities between ICD-10 codes and the ICD-O system. Any incompatible records were sent back to the registry for review and correction.

CHECKING

All datasets with complete ICD-O-3 coding of tumour site, morphology, behaviour (and optionally grade), and basis of diagnosis were run through the IARC-CHECK program included in the IARCcrgTools package, which performed the following checks:

1. Code verification
   - Sex
   - Incidence date (and birth date, if provided and complete)
   - ICD-O-3 topography, morphology, and behaviour.

2. Consistency between items
   - Age versus birth and incidence dates
   - Chronology between birth and incidence dates
   - Sex versus site
   - Sex versus histology
   - Age versus site
   - Age versus histology
   - Site versus histology
   - Basis of diagnosis versus histology.

Registries submitting data for Volume XI were invited to run their data through the IARC-CHECK program before submission, and a large number of contributors did so. The datasets of registries that use CanReg software (available from http://www.iacr.com.fr/) were checked using the equivalent built-in functionalities. All datasets were rechecked by IARC staff. Any errors or unlikely or rare combinations of items were sent back to the registry for verification, unless they were already flagged as double-checked. The received corrections and resubmissions were then consolidated, converted if necessary, and rechecked to ensure that no further errors were found. More than one cycle of data validation was required for many of the datasets.

MULTIPLE PRIMARIES

All records included a unique patient and tumour identification number, so it was possible to check for multiple primary tumours occurring in the same patient using the multiple primary check program included in the IARCcrgTools package. The software lists all sets of tumours recorded for a single patient that should be considered a single primary tumour according to the IARC/IACR rules specifically defined for ICD-O-3

(IARC, 2004) and modified to take into consideration the new terms that appeared in the 2011 revision (see Chapter 3). The longer the time period for which data were submitted, the more complete the identification of multiple primary tumours in the reference period of 2008–2012.

CONVERSION TO ICD-10

When no errors remained, the incidence data were converted from the first (2011) revision of ICD-O-3 to ICD-10 (2010 version), to ensure that the ICD-10 categories resulted from the same conversion process (ICD-O-3 to ICD-10) for all cancer registries. The ICD-O-3 to ICD-10 conversion program was written at IARC and is based on the rules defined in *Conversion of Neoplasms by Topography and Morphology from ICD-O-2 to ICD-10* by Percy (1998). In summary, each new ICD-O-3 morphology code (as listed in Appendix 1 of ICD-O-3) was converted first to the closest ICD-O-2 morphology code using the ICD-O-3 to ICD-O-2 conversion program (Fritz and Ries, 2001), and then the corresponding ICD-O-2 to ICD-10 conversion rule was applied. For example, the ICD-O-3 code M8174/3 (Hepatocellular carcinoma, clear cell type) was converted to the ICD-10 code C22.0, following the rule that applies to the ICD-O-2 code M8170/3 (Hepatocellular carcinoma, not otherwise specified [NOS]). The 2011 revision of ICD-O-3 affected the morphology numerical list only, introducing new terms that have appeared in the recent literature, particularly in the "Lymphoma and leukaemia" group. Therefore, a new conversion table from the first (2011) revision of ICD-O-3 to ICD-10 (2010 version) for the ICD-O-3 morphology codes 9590/3 to 9992/3 was developed (see Chapter 3).

The conversion rules strictly follow the ICD-10 coding rules expressed in the instruction manual of ICD-10 Volume 2 and the alphabetical index of ICD-10 Volume 3. For example, the combination of unknown primary site (ICD-O-3 topography code C80.9) and fibrosarcoma, NOS (ICD-O-3 morphology code 8810/3) was converted to ICD-10 code C49.9 (Connective and other soft tissues, NOS; see ICD-10 Volume 2, p. 74). The ICD-O-3 codes M9950/3, M9960–9965/3, M9971/3, and M9975/3 (myeloproliferative disorders [MPD]), and M9980–9983/3, M9985–9989/3, M9991/3, and M9992/3 (myelodysplastic syndromes [MDS]), for which no ICD-10 code in the malignant C category exists, were converted to the ICD-10 codes D45, D46_, and D47_ (i.e. non-malignant tumours), respectively, and are included and presented in the tables under the categories MPD and MDS (see Chapter 3).

When a dataset was submitted with cases coded to ICD-10 for topography and ICD-O-2 for morphology, the conversion process sometimes produced ICD-10 codes different from those originally provided in the submitted file, as shown in Table 6.1.

Table 6.1. Conversions of datasets with cases coded to ICD-10 for topography (T) and ICD-O-2 for morphology (M)

Classification	Original coding	First conversion	Second conversion	Third conversion
ICD-10	C80 – Unknown primary			C62.9 – Testis, not otherwise specified (NOS)
ICD-O-2 (T)		C80.9 – Unknown primary		
ICD-O-2 (M)	8640/3 – Sertoli cell carcinoma	8640/3 – Sertoli cell carcinoma		
ICD-O-3 (T)			C80.9 – Unknown primary	
ICD-O-3 (M)			8640/3 – Sertoli cell carcinoma	

In the example shown in Table 6.1, the final ICD-10 code is sex-specific and differs from the code provided in the original record. Generally, such changes in ICD-10 codes occurred when a registry did not strictly follow the rules in the ICD-O manuals; in the example shown in Table 6.1, Sertoli cell carcinoma (M8640/3) should have been coded to testis (C62.9) if the site of the tumour was not specified (rule 8 of ICD-O-2 or rule H of ICD-O-3). The ICD-10 code for unspecified site was recoded to skin (C43.9) or bone (C41.9) if the morphological diagnosis was malignant melanoma, regressing (M8723/3) or osteosarcoma (M9180/3), respectively. This example explains why the original ICD-10 codes provided (if any) were not used in the final tabulations.

For certain morphological codes, the conversion was independent of topography. For example, hepatocellular carcinoma (M8170/3) was automatically converted to the ICD-10 code C22.0, irrespective of the ICD-O topography code (whether specific or unknown). Thus, the combination of ICD-O-3 topography code C34.9 (lung, NOS) and morphology code 8170/3 was converted to ICD-10 code C22.0, because the original combination of topography and morphology was obviously incorrect. It was the detection of this kind of error that inspired the creation of the first version

of the IARC-CHECK program, and these errors were detected during the checking process described earlier in this chapter.

MISCELLANEOUS CONVERSIONS

In addition to tumour topography and morphology, certain other variables (sex, basis of diagnosis, ethnic group or race, and dates) were also recoded to a common system according to the descriptions supplied by the registries.

Mortality data

Together with their data on cancer cases, the registries were asked to provide official cancer mortality data for the reference period (2008–2012), ideally for each calendar year of the period. For the national cancer registries, mortality data were extracted from the WHO Mortality Database (https://www.who.int/healthinfo/statistics/mortality_rawdata/en/) by IARC staff. The mortality data were used for editorial purposes as an indicator of the completeness of registration. Because the data were generally provided in tabular form for the available ICD-10 (and sometimes ICD-9) three-digit categories by sex and 5-year age group, only checks for the validity of the ICD code and the combination of sex and site were performed. The data provided by some registries were grouped into wider cancer sites or age groups than conventionally used, and therefore had to be reformatted before being processed by the series of editorial programs and added to the CI5 Volume XI database. Some registries supplied mortality data based on the cancer registry dataset. Such data were not considered by the volume editors to represent official mortality data (see Chapter 5).

Population data

The registries were required to submit population denominators for each individual year of the reference period, by sex and 5-year age groups. In the absence of corresponding data sources, a population denominator for a single central year of the reference period was accepted. The population data were checked first by careful examination of the data file, then by comparing the age distribution with that from the previous CI5 volume, if available. Unexpected changes in the age structure or in the total population by year and sex were identified and queried. After examination, the population files were formatted and added to the CI5 Volume XI database.

THE CI5 VOLUME XI DATABASE

The CI5 Volume XI database contains all the incidence, mortality, and population datasets supplied by the registries and checked by IARC for the project, irrespective of whether they were ultimately selected for inclusion in the volume itself. Incidence data were supplied for all malignant neoplasms, as well as non-malignant (except benign) neoplasms of the bladder. The data are stored as a listing of individual records (without patient identification numbers, which are no longer necessary) containing the eight compulsory variables, with topography and morphology coded to ICD-O-3 together with the corresponding ICD-10 code used for tabulation. The database is hosted and maintained on a protected server at IARC, with access restricted to identified CSU staff members.

CONCLUSION

The complete process of data checking and validation conducted by IARC in collaboration with the cancer registries took several months. The help provided by those contributors who converted and checked their data before submission was greatly appreciated. Although prompt data provision is of the utmost importance, this importance is counterbalanced by the necessity of validating and ensuring the comparability of the global cancer incidence data. Online publication of the data ahead of the published volume provided earlier public access to the results.

The data processing methods described in this chapter resulted in the standardization of the information provided, which enabled the CI5 editors to compare datasets within large defined geographical regions, as described in Chapter 5. The CI5 data validation processes contributed substantially to the overall quality and comparability of the data from all submitting registries, as well as to data harmonization, with the benefit extending beyond this publication.

Chapter 7: Age standardization

Freddie Bray and Jacques Ferlay

INTRODUCTION

For every type of cancer in every population worldwide, age is a key determinant of the risk of developing the disease (Armitage and Doll, 1954). Furthermore, the age structures of the registry catchment populations included in this volume vary considerably. For these two reasons, any global comparisons of incidence rates must be made independent of the effects of age in order to be meaningful. This chapter briefly discusses the summary measures used for this purpose in the preparation of *Cancer Incidence in Five Continents* (CI5), allowing for comparisons of incidence across populations (within Volume XI) and within the same population over time (across consecutive volumes).

In each of the previous 10 volumes of CI5, we have emphasized that an age-specific examination of cancer incidence rates is an essential exploratory step in any comparative analysis, and Volume XI is no exception. Graphical displays of age-specific rates may reveal possible artefacts in the data or provide insight into the biology and etiology of cancer in the population or populations under study. The online resources available at https://ci5.iarc.fr (and the graphical facilities within) allow for a visual inspection that complements the tabulated summaries in the published volume.

To compare incidence across multiple populations or time points, we require a summary measure that absorbs the schedule of age-specific rates in different registries and across time. The crude rate does not take into account the varying age structures in the underlying populations. Therefore, as in previous volumes, two standardized measures – the age-standardized rate and the cumulative rate – are presented; this enables comparisons of cancer risk between registries, independent of the effects of age.

A brief description of the properties of these summary measures is given below, together with the principal calculations involved. Readers who wish to explore the topic in more depth should consult the chapters by Smith (1992) and Day (1992) in CI5 Volume VI. The books by Jensen et al. (1991), Dos Santos Silva (1999), and Kirkwood and Sterne (2003) include chapters that discuss in practical terms the age standardization of cancer data, and Estève et al. (1994) give a more theoretical account of the underlying methodology.

CALCULATING AGE-STANDARDIZED RATES

The age-standardized incidence rate is the summary rate that would have been observed, given the schedule of age-specific rates, in a population with the age composition of some reference population, often called the standard population. Calculation of the standardized rate is an example of direct standardization, whereby the observed age-specific rates are applied (directly) to a theoretical standard population. The calculation is illustrated in Table 7.1, for stomach cancer incidence among females in Yanting County, China (2008–2012), using the world standard population first introduced by Segi (1960), drawn from a pooled population of 46 countries and modified for the first volume of this series by Doll et al. (1966). The Segi–Doll world standard is used in this and all previous volumes of CI5 as a means to rapidly examine geographical and temporal variations in cancer risk.

The main criticism levelled at age-standardized rates concerns the need to select an arbitrary standard population; age-standardized rates can only be meaningfully compared if they refer to the same standard. Although it is clear that the age composition of the world standard is representative of neither the present nor the future age-specific global population, switching to a more up-to-date standard would be worthwhile only if it could provide benefits that outweighed the drawbacks of rendering the Segi–Doll standardized rates obsolete. However, it has been shown that although very different absolute values of age-standardized rates are obtained using different standards, the estimates of age-adjusted relative risk (the main purpose of such routine comparisons) are quite similar (Bray et al., 2002). Therefore, the main effect of changing the standard to a more up-to-date representation of the global population would be the inconsequential result that the value of the age-standardized rate would be closer to that of the crude rate. Accordingly, for both theoretical and practical reasons, the age-standardized rates in this volume are calculated as previously, using the age composition of the Segi–Doll world standard, shown in Table 7.1.

Age groups are indexed by the subscript i, d_i is the number of cases in age group i, y_i is the number of person-years at risk in age group i, and w_i is the number of individuals in (or the weight of) age group i in the world standard population. The crude rate per 100 000 per year is therefore calculated as follows (using the data presented in Table 7.1 as an example):

$$10^5\left(\sum_i d_i\right)\Big/\left(\sum_i y_i\right) = 10^5 \times 1270/1451646 = 87.49$$

Table 7.1. Calculation of age-standardized incidence rates: stomach cancer (ICD-10 C16), China, Yanting County, females (2008–2012)

Age group (years) i	No. of cases d_i	Person-years at risk y_i	Age-specific incidence (per 10^5 years) $10^5(d_i / y_i)$	Standard world population w_i	Expected no. of cases in standard world population $d_i w_i / y_i$
0–4	0	84 468	0.00	12 000	0.00
5–9	0	81 670	0.00	10 000	0.00
10–14	0	72 068	0.00	9 000	0.00
15–19	0	106 093	0.00	9 000	0.00
20–24	0	146 968	0.00	8 000	0.00
25–29	0	149 108	0.00	8 000	0.00
30–34	6	133 780	4.48	6 000	0.27
35–39	35	124 408	28.13	6 000	1.69
40–44	58	102 229	56.74	6 000	3.40
45–49	90	92 643	97.15	6 000	5.83
50–54	117	83 769	139.67	5 000	6.98
55–59	131	75 003	174.66	4 000	6.99
60–64	175	66 514	263.10	4 000	10.52
65–69	171	51 164	334.22	3 000	10.03
70–74	162	37 469	432.36	2 000	8.65
75–79	148	23 505	629.65	1 000	6.30
80–84	95	13 259	716.49	500	3.58
85+	82	7 528	1089.27	500	5.45
Total	1 270	1 451 646	87.49	100 000	69.68

And the age-standardized rate is calculated as follows:

$$\sum_i d_i w_i / y_i = 69.68$$

In this example, the age-standardized rate is 20% less than the crude rate in the same 5-year period. This is because the world standard population has proportionally fewer individuals in the older age groups than does the actual registry population, and the risk of disease (according to the age-specific rates) is higher at older ages.

CUMULATIVE RATE AND CUMULATIVE RISK

The cumulative rate is the sum of the age-specific rates over each year of age from birth to a defined upper age limit. As age-specific incidence rates are usually computed for 5-year age intervals, the cumulative rate is 5 times the sum of the age-specific rates calculated over the 5-year age groups, assuming that the age-specific rates are the same for all ages within a 5-year age group. In the example of stomach cancer incidence in females in the China, Yanting County registry population, all the age groups have a width of 5 years, so the cumulative rate for ages 0 to 74 years is calculated as follows:

$$5\sum_i d_i / y_i = 5 \times 1530.51 \times 10^{-5}$$
$$= 0.0765$$

The cumulative rate is in fact not a rate at all but a dimensionless quantity most conveniently expressed as a percentage. In the example above, the cumulative rate up to the age of 74 years would be given as 7.65%.

The age span over which a rate is accumulated must be specified. In this volume, the age ranges 0–64 years and 0–74 years are used to provide two representations of the lifetime risk of developing the disease. Other age ranges may be more appropriate for more specific purposes, such as investigating childhood cancers.

The cumulative rate's companion – the cumulative risk – is defined as the probability that an individual will develop the disease in question during a certain age span, in the absence of other causes of death. If the cumulative risk in an age range is less than 10%, as is the case with most tumours, it can be approximated very well by the cumulative rate. Table 7.2 shows the correction needed to convert the cumulative rate into the cumulative risk. For values of less than 10%, the difference between the two is small. The precise mathematical relationship between the cumulative rate and the cumulative risk is as follows:

$$\text{cumulative risk} = 1 - \exp(-\text{cumulative rate})$$

Continuing with our example, the cumulative risk is 7.37%, and thus the estimated risk for a female in Yanting County of developing stomach cancer between the ages of 0 and 74 years is estimated as 7.4%. In other words, approximately 1 in 14 females

Table 7.2. Conversion of cumulative rates, 100*x*, into the corresponding cumulative risks, $100(1-e^{-x})$

100*x*	0.1	0.5	1.0	5.0	7.0	10.0	15.0	20.0	30.0	40.0	50.0
$100(1-e^{-x})$	0.1	0.499	0.995	4.88	6.76	9.52	13.93	18.13	25.92	32.97	39.35

would develop stomach cancer in the defined region within the specified lifetime, assuming no other causes of death.

The cumulative rate has two principal advantages over the age-standardized rate. First, because it is a form of direct standardization, the problem of choosing an arbitrary reference population is eliminated. Second, as an approximation of the cumulative risk, it has a greater intuitive appeal, and is more directly interpretable as a measurement of lifetime risk, assuming no other causes of death.

CALCULATING THE STANDARD ERROR

Both the age-standardized rate and the cumulative rate are weighted sums of the age-specific rates, so the standard error can be derived in both cases from the same formula. If the age-specific rate in age group i is estimated from d_i cases and y_i person-years, then the age-standardized rate (with w_i representing the standardization weights) is

$$\sum_i d_i w_i / y_i$$

with an estimated variance (based on the Poisson distribution) of

$$\sum_i d_i \left(w_i / y_i\right)^2$$

and an estimated standard error of

$$\sqrt{\sum_i d_i \left(w_i / y_i\right)^2}$$

For the age-standardized rate, the weights are given by the number of individuals in each age group per 100 000 in the standard population. For the cumulative rate, the weights are equal to the widths of the age groups. When all age groups are 5 years wide, the expression for the standard error (SE) of the cumulative rate (expressed as a percentage) reduces to:

$$\mathrm{SE}\left(\text{cumulative rate}\right) = 500\sqrt{\sum_i d_i / y_i^2}$$

For the example of stomach cancer in females in the China, Yanting County registry population, the estimates (with standard errors) are 69.7 (1.98) for the rate standardized to the world population and 7.65 (0.264) for the cumulative rate (ages 0–74 years).

CASES OF UNKNOWN AGE

The age-standardized rate and the cumulative rate are necessarily corrected for cases of unknown age that occur within the CI5 registry datasets. The correction procedure involves multiplying the summary measure (based on cases of known age) by T/K, where T is the total number of cases of cancer of the same type in individuals of the same sex, and K is the number of cancers occurring in individuals of known age. The standard errors are also multiplied by the same correction factor (T/K).

This correction relies on the assumption that the cases of unknown age are randomly distributed, and therefore have the same age distribution as the cases of known age. In other words, the correction assumes that the probability that the age of a case is unknown does not depend on the age of the case. Although this assumption probably does not hold – it is more likely that age is not recorded among older patients – it is nevertheless important that all registered cases are accounted for, so that the summary statistics are not underestimated.

AVAILABILITY OF DATA FOR UPPER AGE GROUPS

The precision of rates calculated using direct standardization varies according to the number and width of the age groups used. Age-standardized rates, for example, yield slightly different values depending on the extent to which population data are available for the oldest age groups (aged 75 years or more). For most registries, census data are available for the same 18 age groups shown in Table 7.1, enabling the calculation of rates for the upper age ranges of 75–79, 80–84, and 85+. However, some registries can only obtain population data for 16 or 17 age groups, and thus the oldest age groups instead correspond to individuals aged 75+, or 80+, respectively. As an example of the effect of this difference, the age-standardized rate of 69.7 for stomach cancer incidence in females in the China, Yanting County registry population changes to 69.0 when only 16 age groups are used in the calculation instead of all 18 age groups.

SOURCE OF POPULATION
The population of Seychelles is estimated at 93 419 people as at 30 June 2015. This represents an increase of 2060 people or an annual growth rate of 2.2% since 1 July 2014 (National Bureau of Statistics Seychelles, Statistical Bulletin, August 2015).

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

South Africa, Eastern Cape (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION
Based on the 2011 population census. Space-Time Research Census 2011 v1.2, geography, and age is completed years by sex for person, adjusted.

NOTES ON THE DATA
*No official mortality data. No DCO registrations.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Oesophagus	24.0	Cervix uteri	30.0
Prostate	10.3	Oesophagus	14.6
Kaposi sarcoma	6.0	Breast	12.7
Other and unspecified	4.5	Kaposi sarcoma	3.5
Trachea, bronchus, and lung	4.4	Ovary	2.3
Liver	3.9	Other and unspecified	2.1
Larynx	3.2	Corpus uteri	2.0
Mouth	2.9	Liver	1.6
Tongue	1.7	Colon	1.1
Non-Hodgkin lymphoma	1.6	Non-Hodgkin lymphoma	1.1
Stomach	1.4	Trachea, bronchus, and lung	1.0
Colon	1.4	Vulva	0.9
Rectum	1.1	Eye	0.9
Breast	1.0	Stomach	0.8
Penis	0.9	Uterus unspecified	0.7
Bone	0.9	Rectum	0.7
Non-melanoma skin cancer	0.8	Thyroid	0.6
Connective and soft tissue	0.8	Mouth	0.6
Tonsil	0.8	Connective and soft tissue	0.5
Pancreas	0.7	Melanoma of skin	0.5
All sites	78.3	All sites	82.7

Uganda, Kyadondo County (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION
The Uganda Bureau of Statistics provided the population data and used the population census of 2002 with estimates for 2008–2012 assuming a constant annual growth rate.

NOTES ON THE DATA
*No official mortality data.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	46.6	Cervix uteri	49.1
Kaposi sarcoma	24.0	Breast	29.1
Oesophagus	21.1	Kaposi sarcoma	14.1
Liver	9.5	Oesophagus	11.7
Other and unspecified	7.2	Liver	8.1
Non-Hodgkin lymphoma	7.1	Other and unspecified	7.0
Stomach	5.9	Ovary	7.0
Colon	4.0	Non-Hodgkin lymphoma	5.5
Rectum	3.8	Corpus uteri	4.1
Eye	3.2	Colon	4.1
Non-melanoma skin cancer	2.9	Rectum	3.5
Trachea, bronchus, and lung	2.8	Stomach	3.2
Nasopharynx	2.7	Trachea, bronchus, and lung	3.1
Larynx	2.6	Eye	3.0
Mouth	2.3	Pancreas	2.1
Brain and nervous system	2.3	Thyroid	1.9
Pancreas	2.2	Non-melanoma skin cancer	1.8
Penis	2.2	Nasopharynx	1.8
Breast	2.1	Brain and nervous system	1.8
Bladder	2.0	Melanoma of skin	1.6
All sites	176.8	All sites	182.8

Average annual person–years by sex and age group

SOURCE OF POPULATION
In Argentina, a population census is carried out every 10 years by the National Institute of Statistics and Census (INDEC; https://www.indec.gob.ar). Each province has an office that represents the National Institute; in Mendoza, it is the Directorate of Statistics and Economic Research of Mendoza.

Brazil, Curitiba (2008–2011)
Average annual person–years by sex and age group

SOURCE OF POPULATION
Based on the 2010 census (Brazilian Institute of Geography and Statistics; Ministry of Planning, Budget, and Management, Rio de Janeiro; http://www.ibge.gov.br), allowing for births and deaths, but it was not possible to estimate migration into and out of the registration area.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	57.5	Breast	56.5
Non-melanoma skin cancer	36.9	Non-melanoma skin cancer	27.3

Average annual person–years by sex and age group

SOURCE OF POPULATION
Based on the 2000 and 2010 censuses (Brazilian Institute of Geography and Statistics; Ministry of Planning, Budget, and Management, Rio de Janeiro; http://www.ibge.gov.br), allowing for births and deaths, but it was not possible to estimate migration into and out of the registration area.

Average annual person–years by sex and age group

SOURCE OF POPULATION
Population data of Pasto 2008–2012 estimated by the National Administrative Department of Statistics (DANE) using the information from the 2005 census about basic components of population dynamics: fertility, mortality, and migration (internal and international). The data were adjusted through censal conciliation with the 1985 and 1993 censuses and projected until 2020. DANE: Estimates and Projections for the Population, Period 1985–2020. Consulted April 2015.

	§Includes 13 cases of unknown age						§Includes 10 cases of unknown age						

† See note following population pyramid

Ecuador, Loja

CONTRIBUTORS
Jhoanna Castillo Calvas
Anny Gomez Castillo

Ecuador, Loja (2008–2010)
Average annual person–years by sex and age group

SOURCE OF POPULATION
Based on the 2010 census. National Institute of Statistics and Census, Ecuador (INEC; http://www.inec.gob.ec), allowing for births and deaths, but it was not possible to estimate migration into and out of the registration area.

NOTES ON THE DATA
*Rates based on low numbers due to small population.
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

SOURCE OF POPULATION
Postcensal estimates are based on the 2011 census, adjusted for census net undercoverage and the components of demographic growth that occurred since that census. Intercensal estimates are based on the 2006 and 2011 censuses, adjusted for census net undercoverage and postcensal estimates.

Canada, Northwest Territories (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION
Postcensal estimates are based on the 2011 census, adjusted for census net undercoverage and the components of demographic growth that occurred since that census. Intercensal estimates are based on the 2006 and 2011 censuses, adjusted for census net undercoverage and postcensal estimates.

NOTES ON THE DATA
*No DCO registrations. †C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	54.4	Breast	93.0

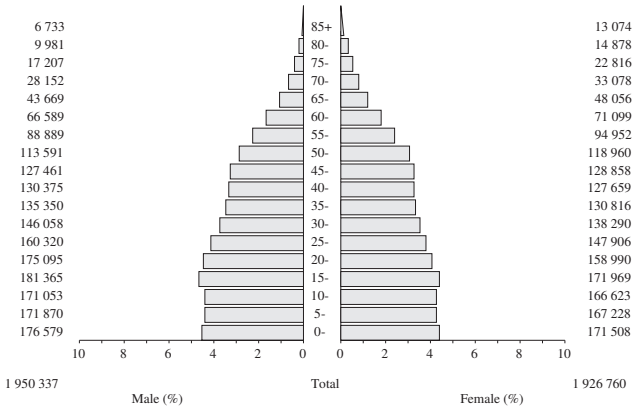
USA, NPCR (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

USA, SEER (18 registries)

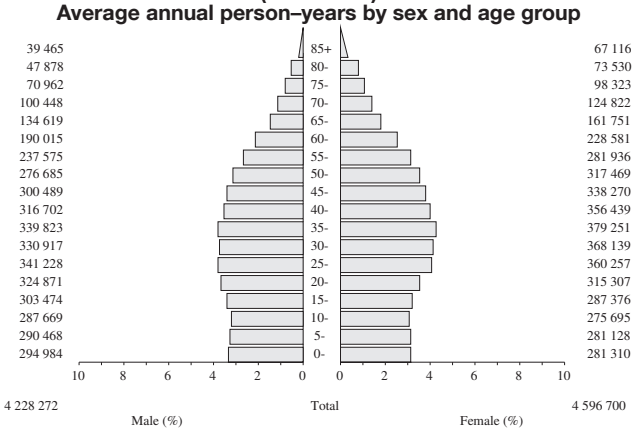
CONTRIBUTORS

Surveillance Research Program, National Cancer Institute

USA, SEER (18 registries) (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION

Provided by the United States Census Bureau, based on decennial censuses and several other surveys, from which annual estimates of the population for each state are derived. Population estimates for the denominators of incidence and mortality rates are race-specific, ethnicity-specific, and sex-specific county population estimates aggregated to the state or metropolitan-area level.



NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	96.0	Breast	85.4
Trachea, bronchus, and lung	41.4	Trachea, bronchus, and lung	30.6
Colon	19.7	Corpus uteri	18.2
Bladder	19.0	Thyroid	16.4
Melanoma of skin	16.9	Colon	15.9
Non-Hodgkin lymphoma	14.0	Melanoma of skin	11.9
Kidney	13.7	Non-Hodgkin lymphoma	9.5

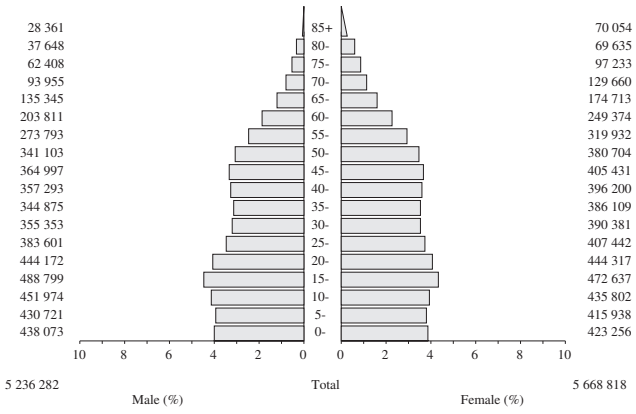
All sites	339.3	All sites	280.8

USA, SEER (18 registries): Asian and Pacific Islander (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION

Population estimates for the denominators of incidence and mortality rates are race-specific, ethnicity-specific, and sex-specific county population estimates aggregated to the state or metropolitan-area level. The county population estimates incorporated into the National Cancer Institute SEER*Stat software are a slight modification of the annual time series of 1 July county population estimates (by age, sex, race, and Hispanic origin).



NOTES ON THE DATA

*No official mortality data. †C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancer

†*See note following population pyramid

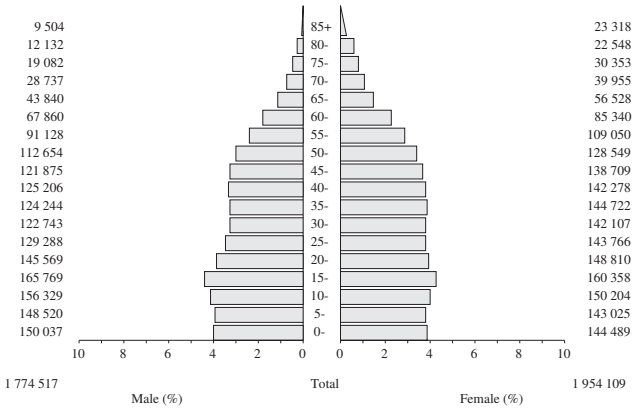
USA, SEER (9 registries)

CONTRIBUTORS
Surveillance Research Program, National Cancer Institute

USA, SEER (9 registries) (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Provided by the United States Census Bureau, based on decennial censuses and several other surveys, from which annual estimates of the population for each state are derived. Population estimates for the denominators of incidence and mortality rates are race-specific, ethnicity-specific, and sex-specific county population estimates aggregated to the state or metropolitan-area level.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

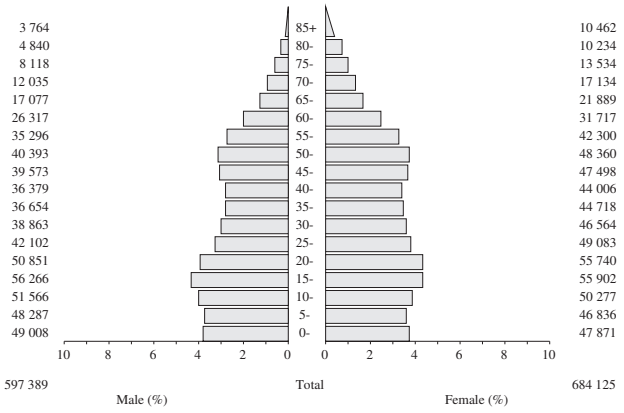
USA, Alabama (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

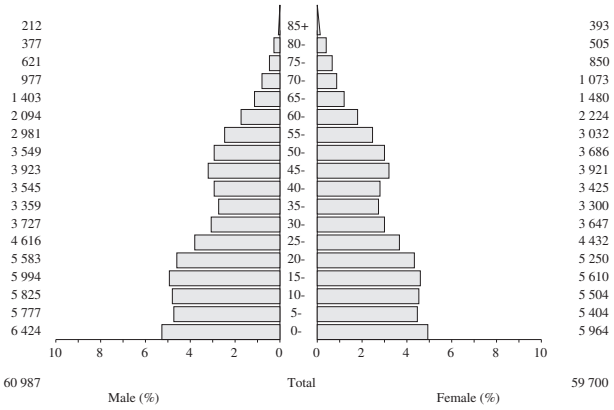
§Includes 2 cases of unknown age

† See note following population pyramid

USA, Alaska

CONTRIBUTORS
Judy Brockhouse
David O'Brien
Evelyn Honeycutt
Diane Sallee
Shannon McLeod

USA, Alaska (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	77.0	Breast	85.2
Trachea, bronchus, and lung	42.1	Trachea, bronchus, and lung	36.0
Colon	20.9	Colon	19.3
Bladder	19.9	Corpus uteri	18.9
Non-Hodgkin lymphoma	12.9	Thyroid	13.7
Kidney	12.5	Non-Hodgkin lymphoma	9.5
Rectum	9.9	Melanoma of skin	8.1
Melanoma of skin	9.1	Ovary	7.8
Liver	8.6	Kidney	6.8

All sites	306.5	All sites	282.3

USA, Alaska: Alaska Natives (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION

Provided by the United States Census Bureau, based on decennial censuses and several other surveys, from which annual estimates of the population for each state are derived. Population estimates for the denominators of incidence and mortality rates are race-specific, ethnicity-specific, and sex-specific county population estimates aggregated to the state or metropolitan-area level.

NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

10 major cancers, ASR (World) per 100 000

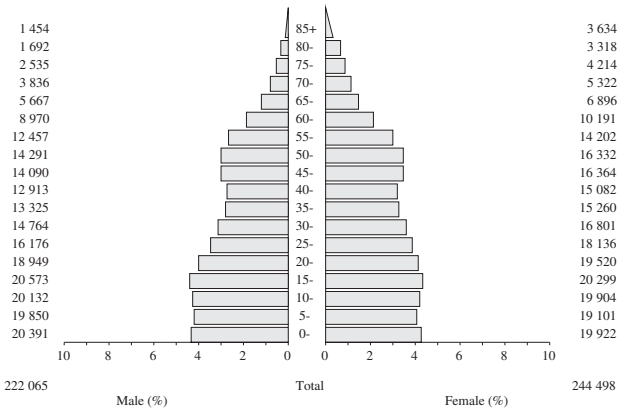
USA, Arkansas (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

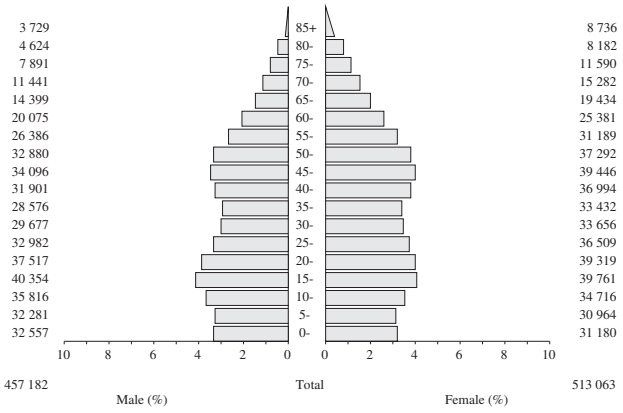
Lihua Liu

USA, California, Los Angeles County (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION

Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.



NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

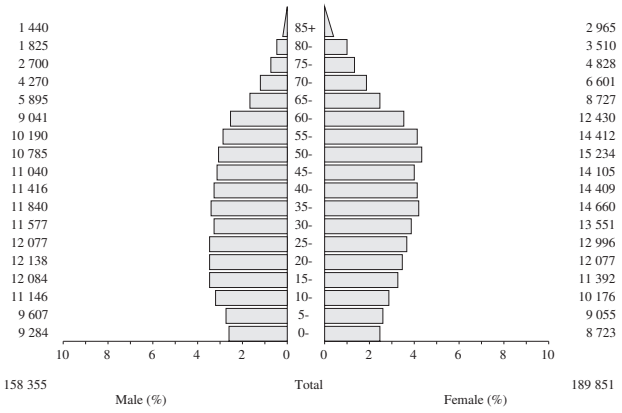
USA, California, Los Angeles County: Chinese (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION

Age-, sex-, and race-specific annual population estimates for 2000–2012 developed by the Los Angeles Cancer Surveillance Program for its catchment area: Los Angeles County (LAC). Estimates for 2000–2010 based on linear interpolations between the 2000 and 2010 census results for LAC. Estimates for 2011–2012 obtained by extrapolating the 2000–2010 population trends. Age- and sex-specific population counts for each racial group were represented by the simple average between the single-race (the minimum) and multiple-race (the maximum) counts of population for that racial group in each census year, respectively.



NOTES ON THE DATA

*No official mortality data. †C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

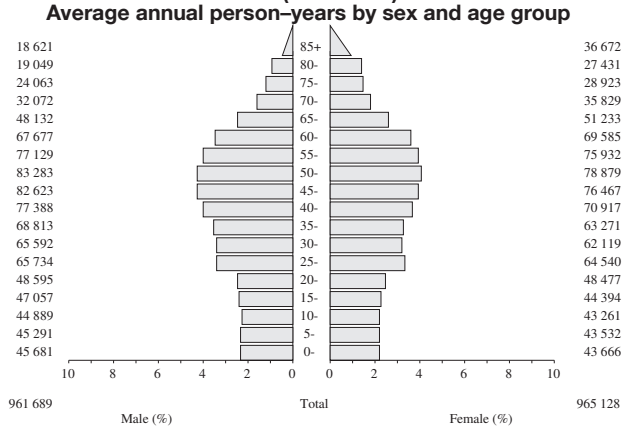
USA, California, San Francisco Bay Area: Hispanic White (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION

Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.



NOTES ON THE DATA

*No official mortality data. †C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

10 major cancers, ASR (World) per 100 000

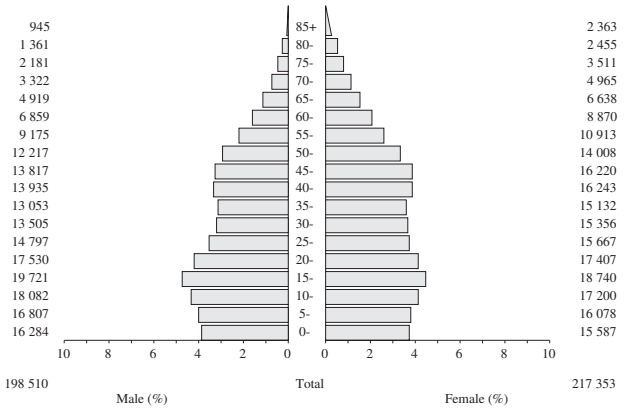
USA, Connecticut (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Provided by the United States Census Bureau, based on decennial censuses and several other surveys, from which annual estimates of the population for each state are derived. Population estimates for the denominators of incidence and mortality rates are race-specific, ethnicity-specific, and sex-specific county population estimates aggregated to the state or metropolitan-area level.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

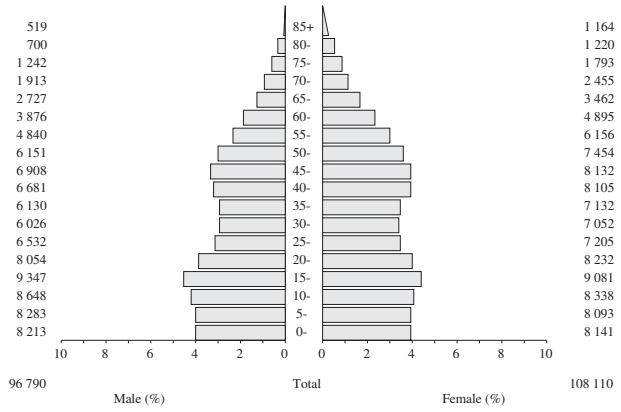
USA, Delaware (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

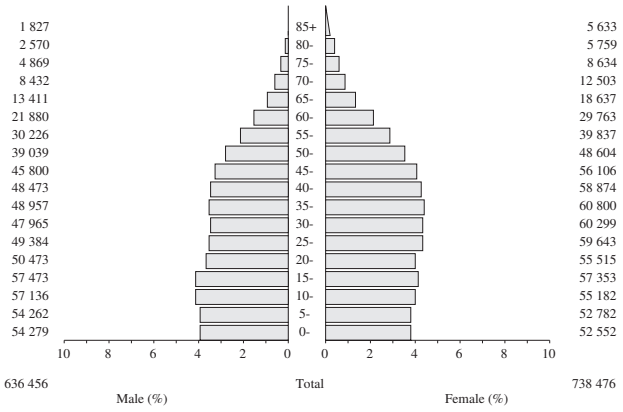
Mary Lyn Almon

USA, Georgia, Atlanta (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION

Provided by the United States Census Bureau, based on decennial censuses and several other surveys, from which annual estimates of the population for each state are derived. Population estimates for the denominators of incidence and mortality rates are race-specific, ethnicity-specific, and sex-specific county population estimates aggregated to the state or metropolitan-area level.



NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

CONTRIBUTORS
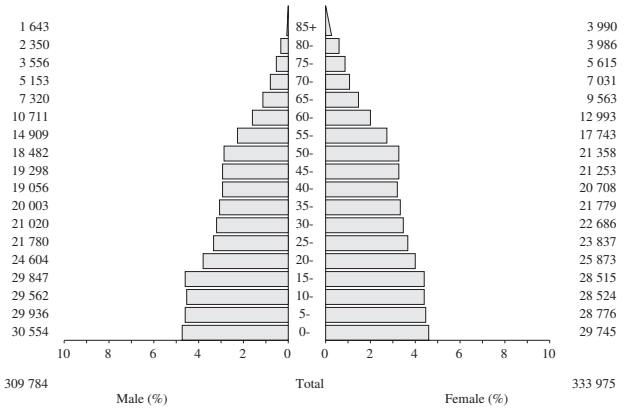
Laura P. Ruppert

USA, Indiana (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Average annual person–years by sex and age group

SOURCE OF POPULATION
Provided by the United States Census Bureau, based on decennial censuses and several other surveys, from which annual estimates of the population for each state are derived. Population estimates for the denominators of incidence and mortality rates are race-specific, ethnicity-specific, and sex-specific county population estimates aggregated to the state or metropolitan-area level.

NOTES ON THE DATA

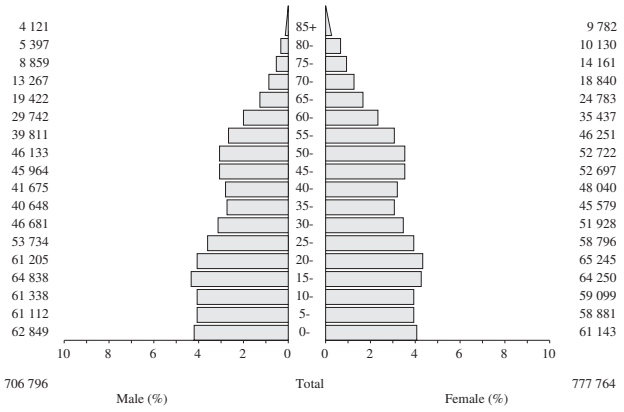
USA, Louisiana (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

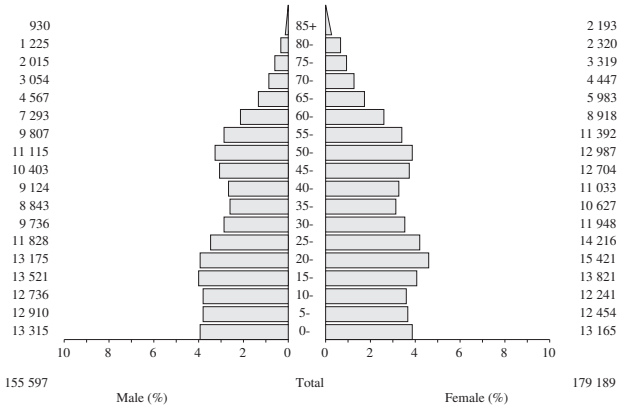
USA, Louisiana, New Orleans (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	109.3	Breast	88.4
Trachea, bronchus, and lung	53.3	Trachea, bronchus, and lung	36.0
Colon	23.1	Colon	18.6
Bladder	18.7	Corpus uteri	14.1
Non-Hodgkin lymphoma	16.6	Thyroid	12.4
Kidney	16.5	Non-Hodgkin lymphoma	10.0
Liver	12.3	Kidney	9.4

USA, Maine

CONTRIBUTORS
Molly Schwenn

USA, Maine (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	83.7	Breast	85.6
Trachea, bronchus, and lung	51.4	Trachea, bronchus, and lung	41.6

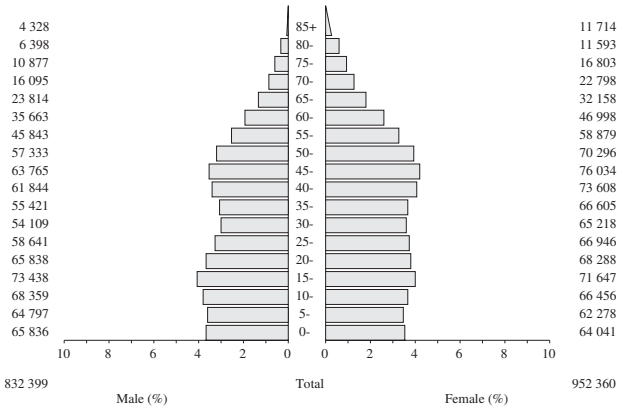
USA, Maryland (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

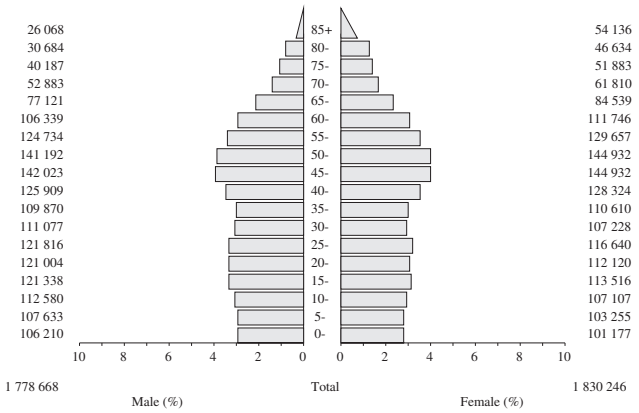
Average annual person–years by sex and age group

SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.



NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	97.4	Breast	94.2
Trachea, bronchus, and lung	44.4	Trachea, bronchus, and lung	39.0
Bladder	23.3	Thyroid	23.9
Colon	17.7	Corpus uteri	21.9
Melanoma of skin	16.4	Colon	15.2
Kidney	14.3	Melanoma of skin	13.1
Non-Hodgkin lymphoma	14.1	Non-Hodgkin lymphoma	9.6

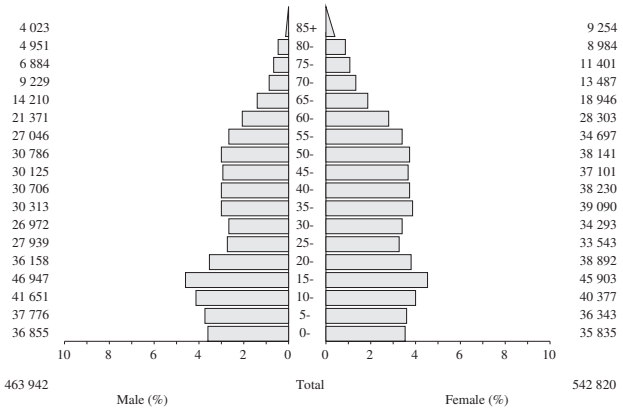
USA, Michigan, Detroit (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Provided by the United States Census Bureau, based on decennial censuses and several other surveys, from which annual estimates of the population for each state are derived. Population estimates for the denominators of incidence and mortality rates are race-specific, ethnicity-specific, and sex-specific county population estimates aggregated to the state or metropolitan-area level.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

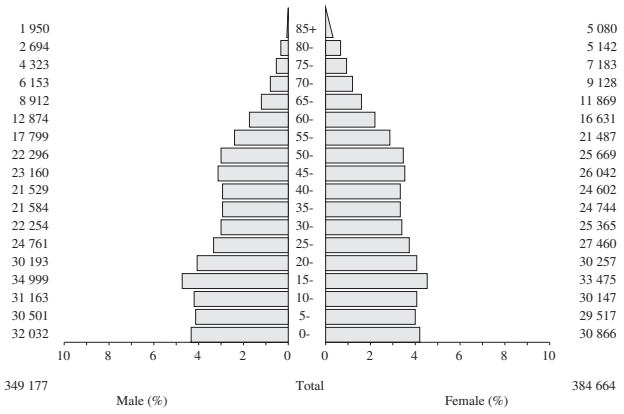
USA, Missouri

CONTRIBUTORS
Jeannette Jackson-Thompson
Saba Yemane
Chester Schmaltz

USA, Missouri (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

§Includes 2 cases of unknown age

† See note following population pyramid

USA, Montana

CONTRIBUTORS
Debbi Lemons

USA, Montana (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	93.0	Breast	84.1
Trachea, bronchus, and lung	38.1	Trachea, bronchus, and lung	32.2

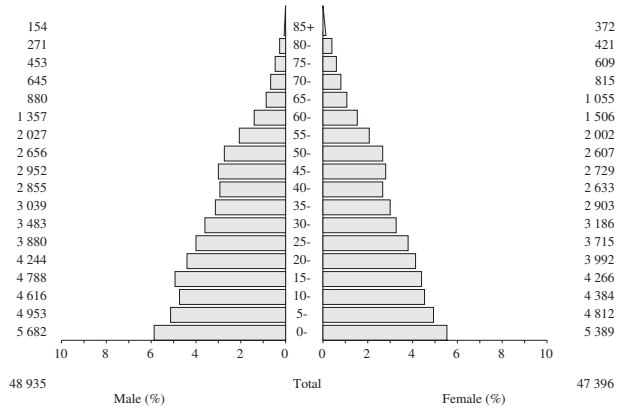
USA, Nebraska (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

USA, New Hampshire

CONTRIBUTORS
Judy R. Rees
Whitney Hammond
Maria O. Celaya
Bruce L. Riddle

USA, New Hampshire (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	100.7	Breast	91.4
Trachea, bronchus, and lung	44.4	Trachea, bronchus, and lung	39.4

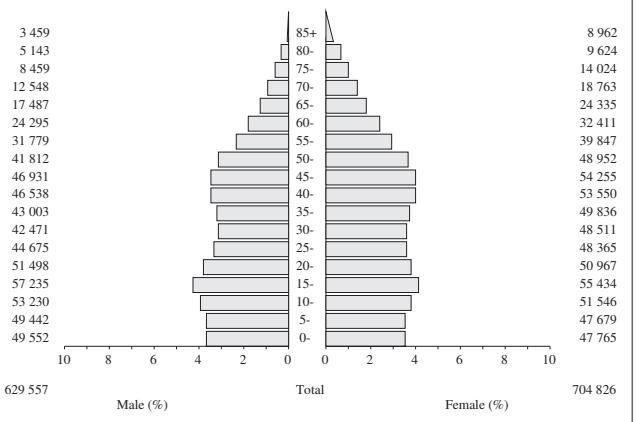
USA, New Jersey (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

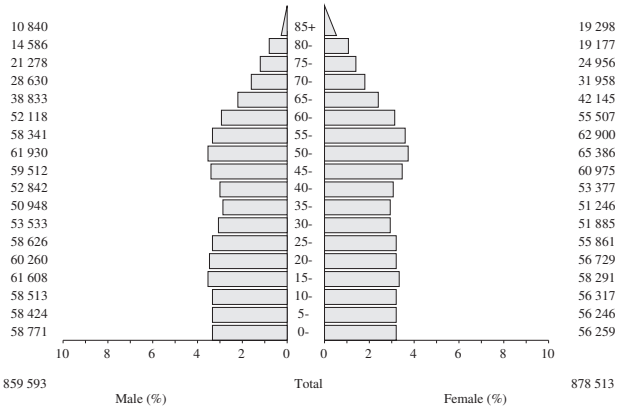
USA, New Mexico (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Provided by the United States Census Bureau, based on decennial censuses and several other surveys, from which annual estimates of the population for each state are derived. Population estimates for the denominators of incidence and mortality rates are race-specific, ethnicity-specific, and sex-specific county population estimates aggregated to the state or metropolitan-area level.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	76.3	Breast	76.6
Trachea, bronchus, and lung	29.3	Trachea, bronchus, and lung	22.5

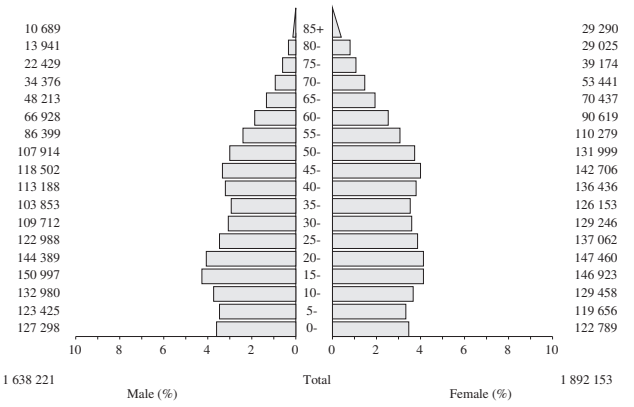
USA, New York State (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

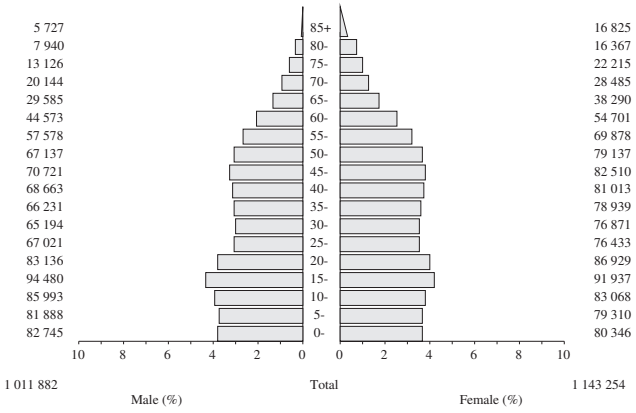
CONTRIBUTORS
Chandrika Rao
Gary Leung
Soundarya Radhakrishnan

USA, North Carolina (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	97.1	Breast	86.5
Trachea, bronchus, and lung	56.5	Trachea, bronchus, and lung	35.8

CONTRIBUTORS
Mary Ann Sens
Yun Zheng
Xudong Zhou
Cristina Oancea

USA, North Dakota (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	99.0	Breast	83.9
Trachea, bronchus, and lung	39.6	Trachea, bronchus, and lung	28.8

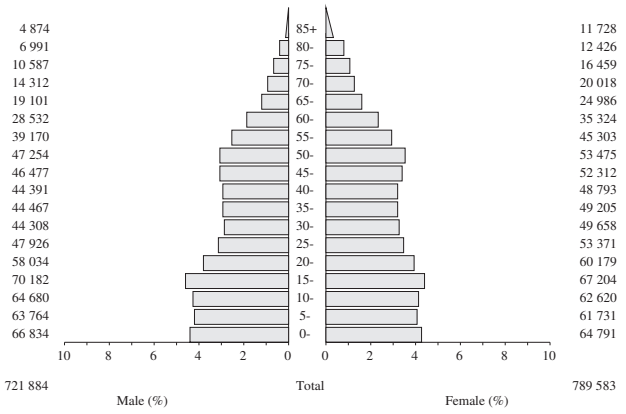
§Includes 1 case of unknown age

† See note following population pyramid

USA, Ohio

CONTRIBUTORS
Lynn Giljahn
Barbara Warther

USA, Ohio (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

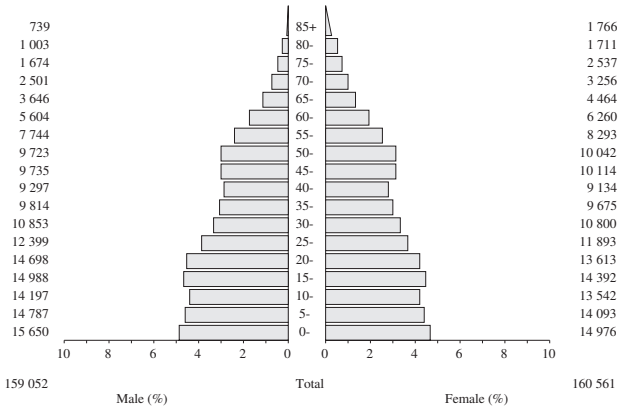
USA, Oklahoma (2008–2012)
Average annual person–years by sex and age group



SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	86.0	Breast	79.8
Trachea, bronchus, and lung	55.0	Trachea, bronchus, and lung	38.4
Colon	20.9	Colon	17.0

† See note following population pyramid

USA, South Dakota

CONTRIBUTORS
Kay Dosch

USA, South Dakota (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	90.1	Breast	86.2
Trachea, bronchus, and lung	40.9	Trachea, bronchus, and lung	30.8
Colon	21.1	Corpus uteri	19.4
Bladder	18.1	Colon	16.4

§Includes 1 case of unknown age

† See note following population pyramid

USA, Utah

CONTRIBUTORS
Judy Ou

USA, Utah (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION
Provided by the United States Census Bureau, based on decennial censuses and several other surveys, from which annual estimates of the population for each state are derived. Population estimates for the denominators of incidence and mortality rates are race-specific, ethnicity-specific, and sex-specific county population estimates aggregated to the state or metropolitan-area level.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	108.4	Breast	77.1
Melanoma of skin	26.5	Thyroid	23.0
Trachea, bronchus, and lung	20.7	Corpus uteri	18.6
Bladder	16.0	Melanoma of skin	17.6
Colon	15.1	Trachea, bronchus, and lung	14.9

Average annual person–years by sex and age group

SOURCE OF POPULATION
Provided by the United States Census Bureau, based on decennial censuses and several other surveys, from which annual estimates of the population for each state are derived. Population estimates for the denominators of incidence and mortality rates are race-specific, ethnicity-specific, and sex-specific county population estimates aggregated to the state or metropolitan-area level.

Brenda Shehab

USA, West Virginia (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	77.0	Breast	76.5
Trachea, bronchus, and lung	63.9	Trachea, bronchus, and lung	44.0

§Includes 2 cases of unknown age

† See note following population pyramid

USA, Wyoming

CONTRIBUTORS
Julia Espinoza
Joe Grandpre

USA, Wyoming (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION
Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Prostate	88.0	Breast	75.0
Trachea, bronchus, and lung	33.1	Trachea, bronchus, and lung	28.2
Bladder	20.6	Thyroid	16.2

Average annual person–years by sex and age group

SOURCE OF POPULATION
Population by sex and age distribution (single year group) is provided annually by the Beijing Municipal Public Security Bureau, which has a real-time population registry system collecting information on births, deaths, marriages, migration, etc. For convenience of use, the population was calculated for the standard 18 age groups.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Trachea, bronchus, and lung	37.9	Breast	40.9

China, Benxi (2008–2011)
Average annual person–years by sex and age group

SOURCE OF POPULATION
Based on the annual demographic report provided by the Benxi Public Security Bureau; the population composition of Benxi in 2000 was used to calculate the sex- and age-specific population in 2008–2011. Data for 2012 were calculated using the centenarians table: (population at end of 2012 + population at end of 2011)/2.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

China, Cixian County (2008–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION
Annual population from Cixian economic and social development statistical data provided by the National Bureau of Statistics of China. Census data from 2000 were used as a benchmark; based on the modified fertility patterns and mortality patterns, the multifactor population prediction method was used to calculate the population of Cixian by sex and age group.

Average annual person–years by sex and age group

SOURCE OF POPULATION
Based on the 2000 and 2010 censuses, using interpolation calculations in the 2008 population, making allowances for births and deaths based on the form of the 2010 population to estimate the population data for the following years. but it was not possible to estimate migration into and out of the registration area.

NOTES ON THE DATA
*Low levels of specificity of leukaemias, and very few lymphomas.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Oesophagus	58.8	Oesophagus	29.0
Trachea, bronchus, and lung	45.1	Breast	19.1
Liver	39.3	Trachea, bronchus, and lung	16.2
Stomach	32.2	Stomach	13.0
Rectum	7.4	Liver	11.8
Other and unspecified	3.7	Rectum	5.5
Pancreas	3.2	Cervix uteri	4.1
Brain and nervous system	3.2	Corpus uteri	3.4
Leukaemia unspecified	2.9	Ovary	3.2
Colon	2.7	Colon	2.8
Bladder	2.6	Other and unspecified	2.6
Non-Hodgkin lymphoma	2.3	Leukaemia unspecified	2.5
Nasopharynx	2.1	Brain and nervous system	2.3
Larynx	1.7	Pancreas	2.0
Prostate	1.6	Thyroid	1.8
Bone	1.6	Gallbladder etc.	1.3
Gallbladder etc.	1.5	Bone	1.2
Kidney	1.1	Non-Hodgkin lymphoma	1.1
Myeloid leukaemia	0.9	Bladder	1.1
Lymphoid leukaemia	0.8	Nasopharynx	1.0
All sites	221.4	All sites	130.9

China, Zhuhai (2010–2012)
Average annual person–years by sex and age group

SOURCE OF POPULATION
Based on annual census data provided by the Zhuhai Statistical Bureau, but it was not possible to estimate migration into and out of the registration area.

NOTES ON THE DATA
†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

Male		*Female*	
Trachea, bronchus, and lung	52.1	Breast	34.8
Liver	42.6	Trachea, bronchus, and lung	27.9
Nasopharynx	24.0	Cervix uteri	15.0
Colon	14.9	Colon	12.4
Stomach	14.5	Liver	9.5
Rectum	13.8	Nasopharynx	9.0
Oesophagus	9.3	Rectum	8.7
Prostate	9.2	Ovary	8.2
Bladder	8.0	Corpus uteri	8.0
Other and unspecified	6.8	Thyroid	8.0
Non-Hodgkin lymphoma	6.0	Stomach	7.5
Brain and nervous system	4.7	Other and unspecified	5.8
Pancreas	3.9	Brain and nervous system	5.0
Kidney	3.0	Non-Hodgkin lymphoma	4.7
Larynx	2.9	Oesophagus	3.0
